

# Mitigation measures for Endangered, Threatened and Protected species

Alessandro Lucchetti

# Goals of the lesson

What is bycatch

How to assess bycatch

Bycatch by groups of species and gears

Bycatch estimates

How to mitigate bycatch

# Definitions

## Vulnerable species

A taxon is considered vulnerable when facing a high risk of extinction in the wild in the medium-term future, unless the circumstances that are threatening its survival and reproduction improve (IUCN, 2017).

Barcelona Convention for the Protection of the Marine Environment and the Coastal Region of the Mediterranean (1995): Appendix II (endangered or threatened species) and Appendix III (species whose exploitation is regulated) of the Convention for the Protection of the Marine Environment and the Coastal Region of the Mediterranean

The most widely accepted classification for the conservation of species is the Red List of Threatened Species of the International Union for Conservation of Nature (IUCN).

# Definitions

IUCN Red List of Threatened Species : it is a comprehensive inventory of the global conservation status of biological species. It uses a set of criteria to evaluate the extinction risk of thousands of species and subspecies

Several categories: 'near threatened', 'vulnerable', 'endangered' or 'critically endangered'. Acronym: endangered, threatened and protected (ETP)

A species is categorized as 'vulnerable' according to such as reduction in population size, reduction in geographic range, or probability of extinction in the wild (IUCN, 2017). Thus vulnerability can be caused by habitat loss or direct mortality as a result of human activities

# Definitions

## But what's a protected species?

Species of particular scientific, ecological, cultural, or economic value, often rare or threatened.

It can be an organism (animal or plant, for example **Posidonia**) that lives in the sea and benefits from special legal protections to prevent its extinction or depletion—that is, its reduction.

# Why to protect?

## Biological vulnerability (K-strategists)

Many marine mammals, turtles, elasmobranchs, and several seabirds have: slow growth, late maturity, few offspring/eggs, and long lifespans. Therefore, they recover slowly even after moderate population declines.

## Loggerhead sea turtle (*Caretta caretta*)

- About 100 eggs per nest, but only ~1–2 out of 1,000 hatchlings reach maturity ( $\approx 0.1\text{--}0.2\%$ ).
- About 16–28 years to reach “adult” sizes associated with maturity: roughly ~80 cm carapace length and 50–70 kg.

# Why to protect?

## Biological vulnerability (K-strategists)

Many marine mammals, turtles, elasmobranchs, and several seabirds have: slow growth, late maturity, few offspring/eggs, and long lifespans. Therefore, they recover slowly even after moderate population declines.

## Great white shark (*Carcharodon carcharias*)

- Typically 2–10 pups.
- Maturity at around ~26 years in males and ~33 years in females.
- Males: mature at about 3.5–4.1 m total length (TL);
- females: mature at about 4.2–5.2 m TL.
- Newborns are large: ~109–165 cm TL and about ~20–30 kg.
- In the Mediterranean, there are likely fewer than 250 mature individuals remaining.

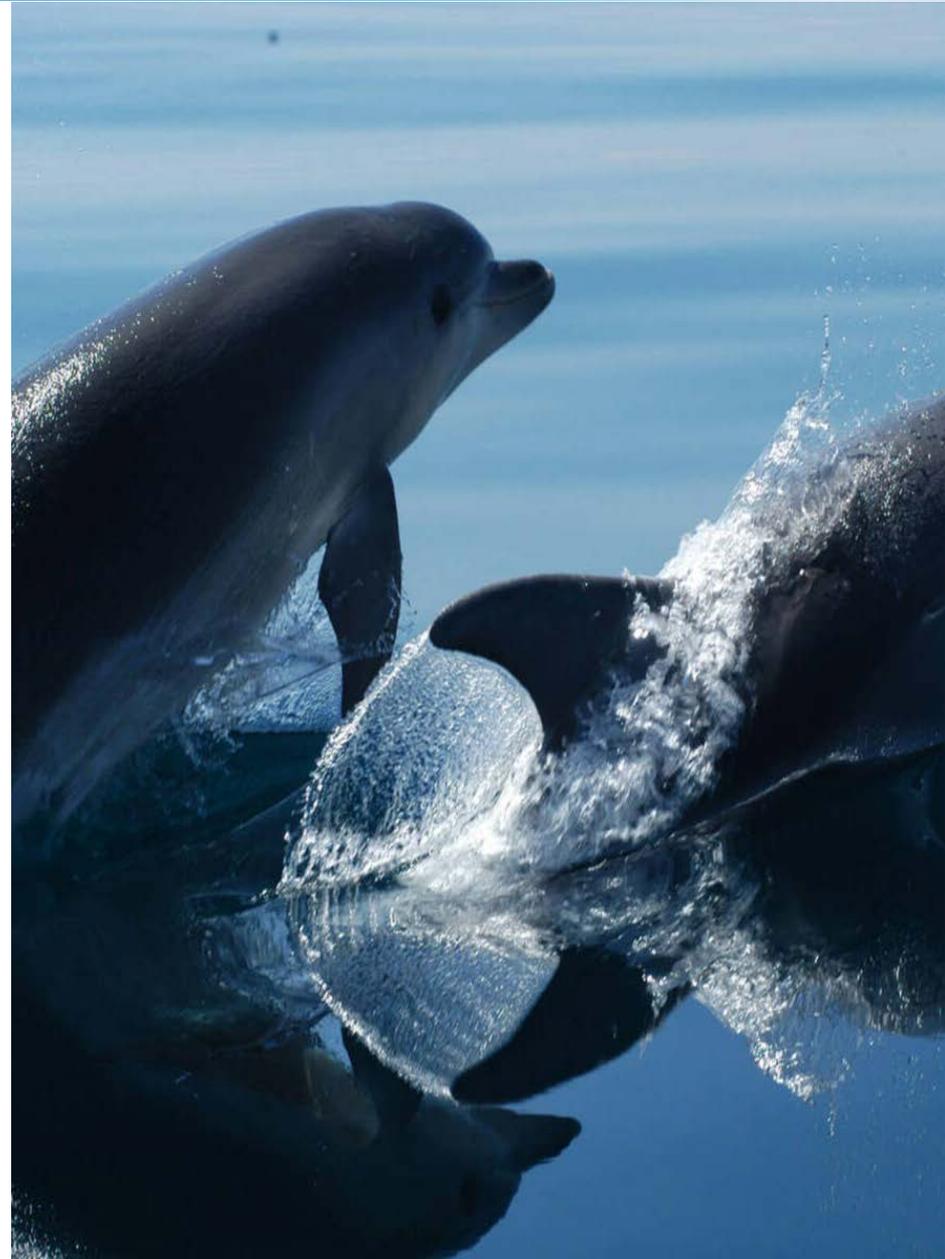

# Why to protect?

## **Biological vulnerability (K-strategists)**

Many marine mammals, turtles, elasmobranchs, and several seabirds have: slow growth, late maturity, few offspring/eggs, and long lifespans. Therefore, they recover slowly even after moderate population declines.

## **Bottlenose dolphin (*Tursiops truncatus*)**

- Up to 11 births per female;
- average interval between pregnancies of 3–4 years.
- Females: sexual maturity is often reported between 7 and 12 years.
- Gestation: ~12 months.
- Newborn: birth length about 0.84–1.4 m; typical weight ~20 kg.

# Why to protect?

## Role in the ecosystems

Protecting marine species is essential because they

- sustain ecosystem equilibrium by regulating food webs through predation
- Food-web regulation (predation, grazing, scavenging that stabilizes trophic cascades)
- Connectivity between habitats (migrations and movements linking coastal–offshore systems; seed/larval dispersal) acting as ecological connectors that link habitats and maintain the flow of energy and biomass across seascapes
- by recycling nutrients
- To-down control of food webs
- Disease and pest control (removing weak/sick prey; controlling outbreak-prone species)

# Why to protect?

## Ecosystem services

- Water quality support (filtration by bivalves, sediment trapping by seagrass, reduced turbidity)
- Sediment stabilization & coastal protection (attenuating waves, reducing erosion, shoreline buffering)
- Nursery and shelter provision (creating refuges and recruitment habitat for fish and invertebrates)
- Support to fisheries productivity (spillover, maintaining key functional groups, healthier stocks over time)
- Cultural ecosystem services (recreation, ecotourism, education, heritage and identity values)
- Scientific and educational value (indicator species, sentinels of change, research opportunities)

# Why to protect?

## **High and cumulative human pressures**

They are affected by multiple factors at the same time: bycatch, depredation and conflicts with fisheries, habitat loss/degradation, pollutants (chemical and plastic), underwater noise, vessel traffic, climate change, and alien/invasive species. These impacts add up and can amplify each other.

## **Risk of extinction and irreversibility**

When populations fall below critical thresholds (loss of genetic diversity), recovery can become unlikely or impossible within management-relevant timescales.

## **Indicator of environmental status**

Many of these species are sentinels: they accumulate contaminants and are influenced by prey availability and habitat quality. Their condition reflects the ecosystem's "good status" (also useful for MSFD/GES).

# Why to protect?

## **Socio-economic and cultural value**

They support nature-based tourism and local identity; their presence increases the perceived value of coastal areas. Their loss can harm local economies and the environmental reputation of a territory.

## **Regulatory obligations and international responsibility**

They are often covered by listings and conventions (e.g., IUCN, CITES, CMS, regional agreements) and by EU/national obligations (e.g., Habitats/Birds Directives, MSFD). Protecting them reduces legal risks and can facilitate access to funding and management tools.

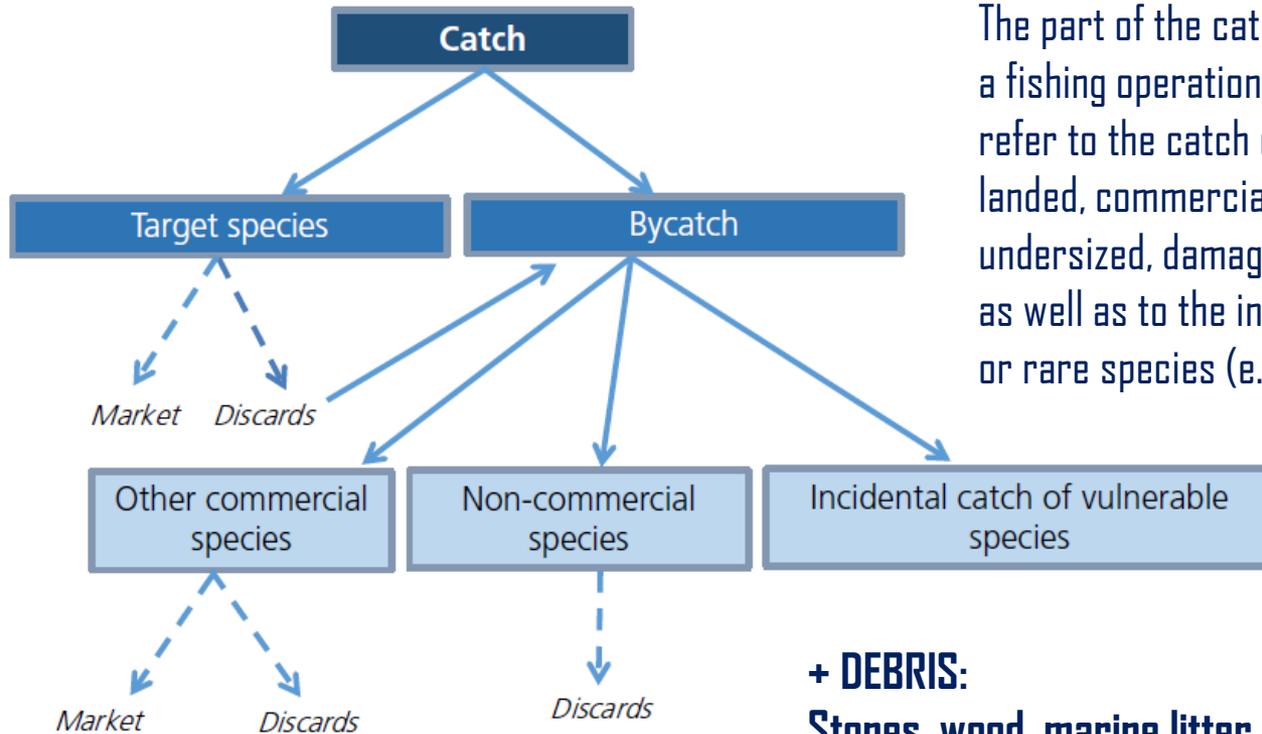

# Why to protect?

## **Ethics and animal welfare (especially for vertebrates)**

There is an ethical motivation to reduce suffering and avoidable mortality (bycatch, gear-related injuries, collisions, plastic ingestion), alongside growing public awareness and concern.

# Definitions

## BYCATCH:

The part of the catch that is unintentionally captured during a fishing operation in addition to the target species. It may refer to the catch of other commercial species that are landed, commercial species that cannot be landed (e.g. undersized, damaged individuals), non-commercial species as well as to the incidental catch of endangered, vulnerable or rare species (e.g. sea turtles, sharks, marine mammals).

## + DEBRIS:

# Definitions

## Bottom trawl

Bycatch, discard

Bycatch, commercial: *Umbrina cirrhosa*

Bycatch, vulnerable: *Caretta caretta*

Target species: *Squilla mantis*

# Definitions

Target species: *Xiphias gladius*

## Longline

Bycatch, vulnerable

Bycatch, commercial:  
*Thunnus alalunga*

*Coryphaena hippurus*

# Problem

Commercial fishing operations are one of the main causes of human-related injury and mortality for vulnerable species

Different fishing gears (trawls, passive nets, longlines etc.) can affect different species and different life stages

- 
- Area
  - Depth
  - Gear properties (mesh size, net height, hook size and shape etc.)
  - Towing speed
  - Season

Fisheries can also impact marine animals unintentionally or indirectly by reducing their critical habitat and the availability of their prey

# Problem

Bycatch of vulnerable species is a growing concern for

- Conservation organizations
  - Scientists
  - Fishing industries
  - Resource managers
- Large size of first maturity;
  - high age of first maturity;
  - Low growth rate;
  - Long lived;
  - Low reproduction output
- } "*k strategy*"

Vulnerable species: low reproductive rates, low growth rate, elevated parental care (mammals), and low rates of natural mortality, "k" strategist species, may suffer greater impacts than "r" strategist species

# Problem

- DIRECT MORTALITY

Direct mortality occurs when the animal is found dead inside the fishing gear due to drowning, injuries due to entanglement or due to impacts with the fishing gear components

- DELAYED MORTALITY

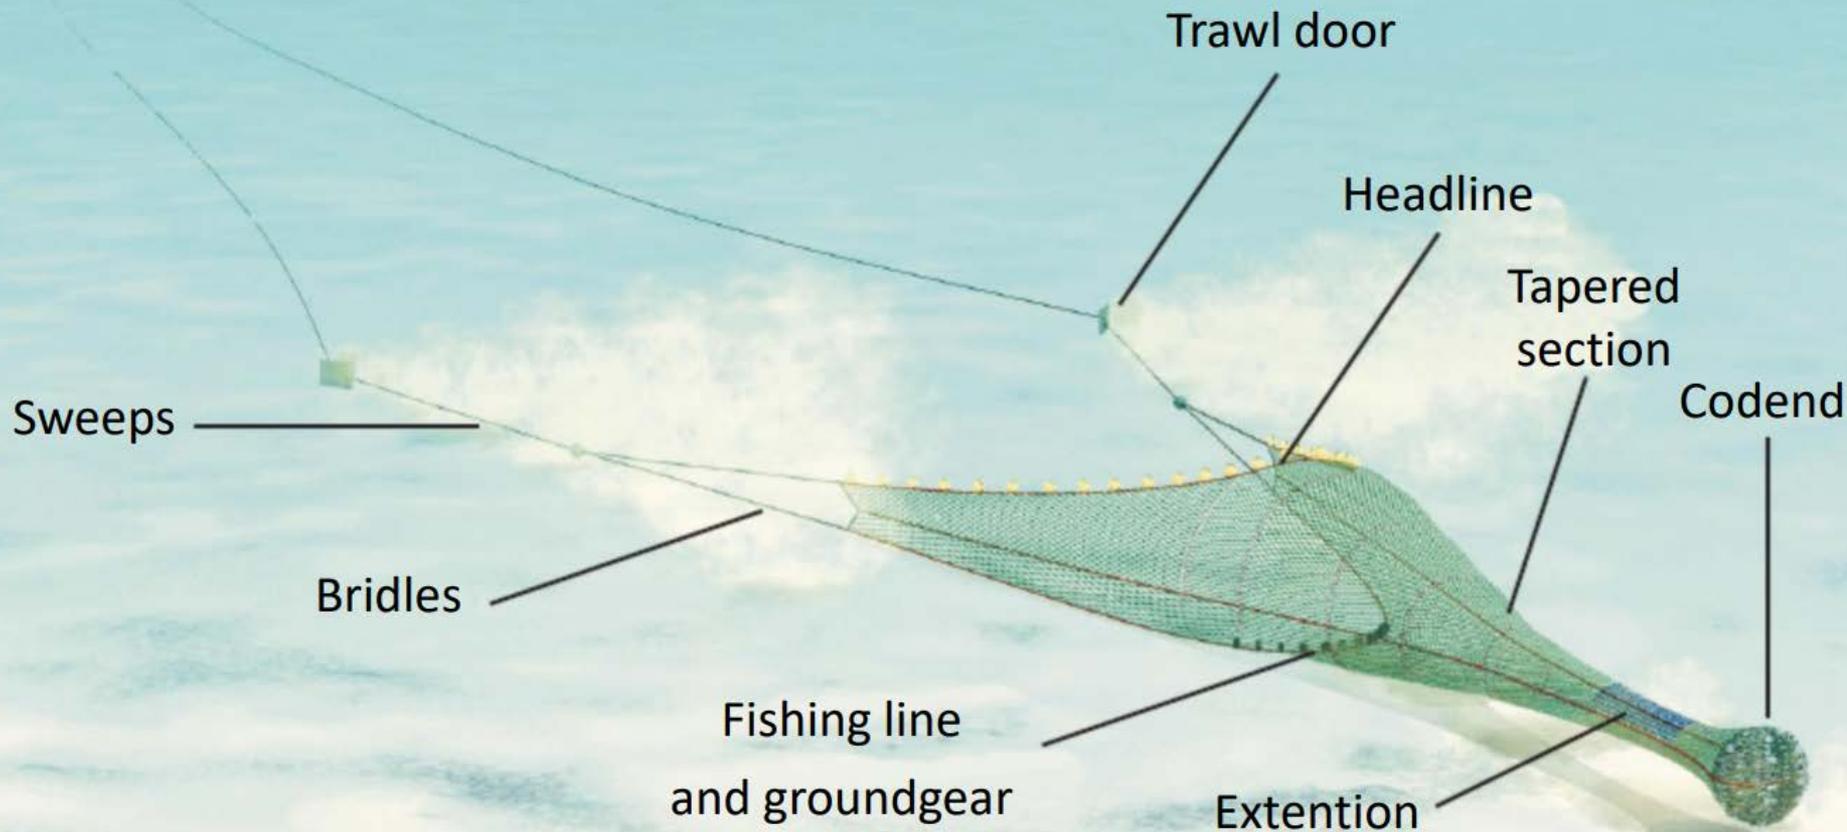

Delayed mortality occurs when the animal is released in apparently good condition, but dies after hours or days from damage caused by being underwater (anoxia, gas embolism, wounds etc.)

# Gaps in knowledge

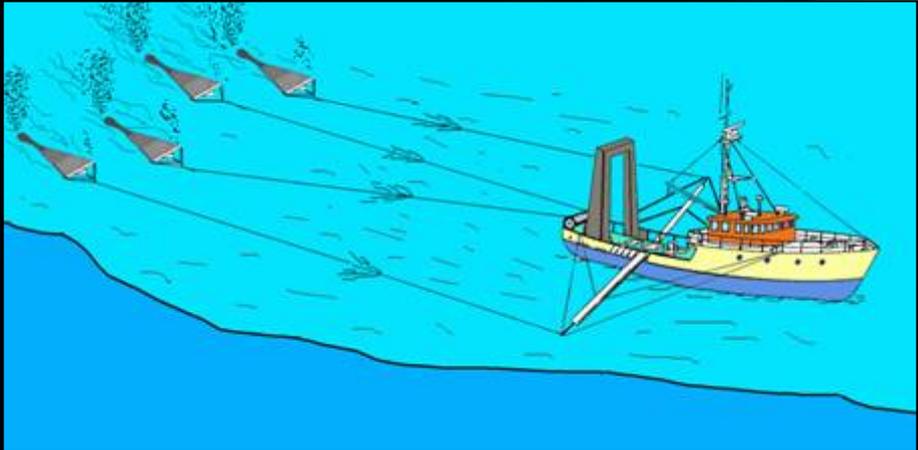

- Absence of both quantitative and qualitative data: studies on incidental catch of vulnerable species are absent for many fishing gear and countries of the Mediterranean and the Black Sea.
- There is not a standard for monitoring and data collection
- Several databases (local), data gap and consistency
- This means that defining clear management targets for most fisheries is problematic.

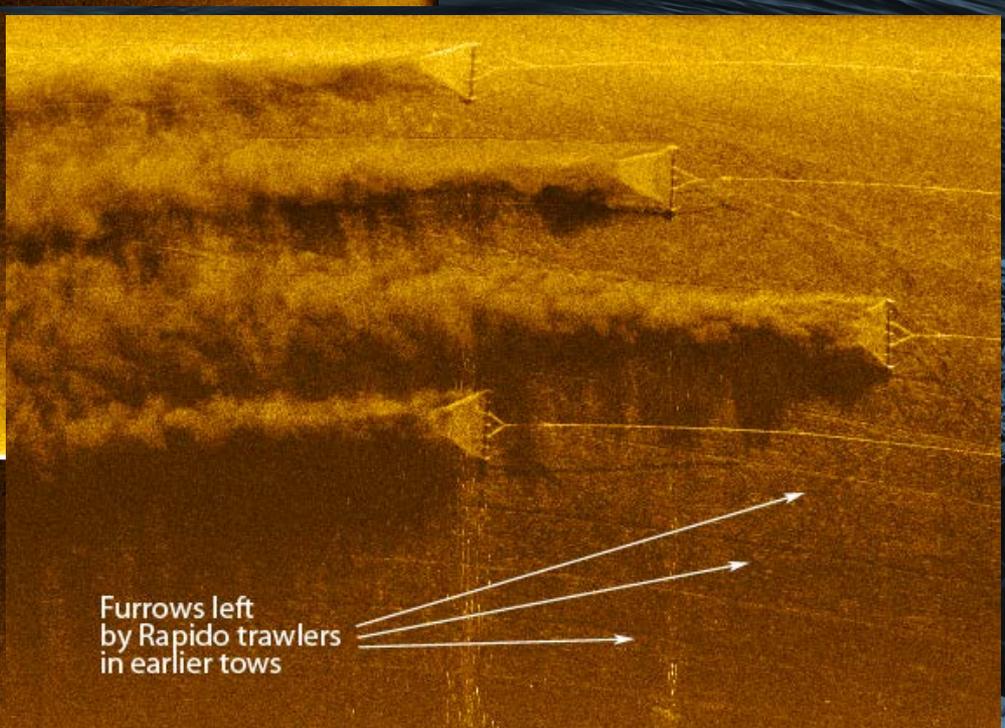

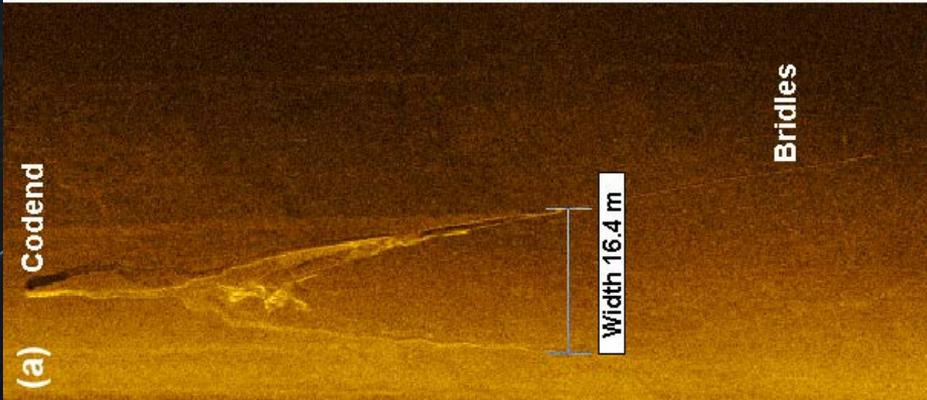

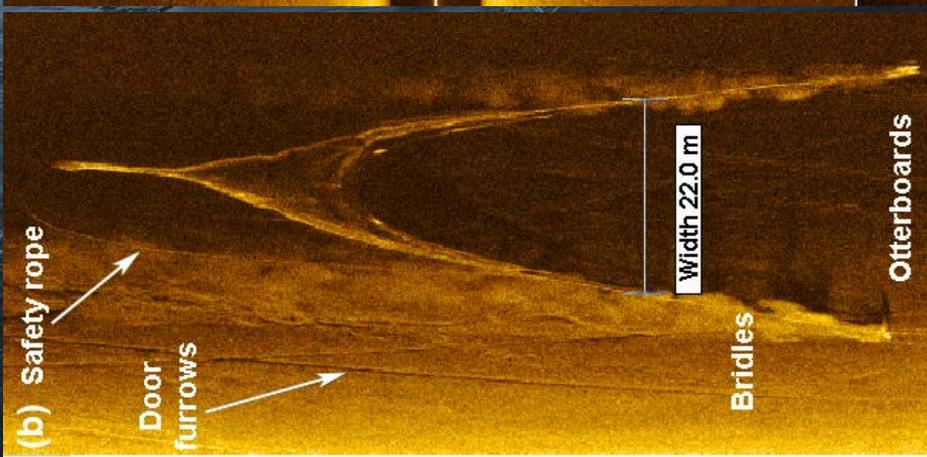

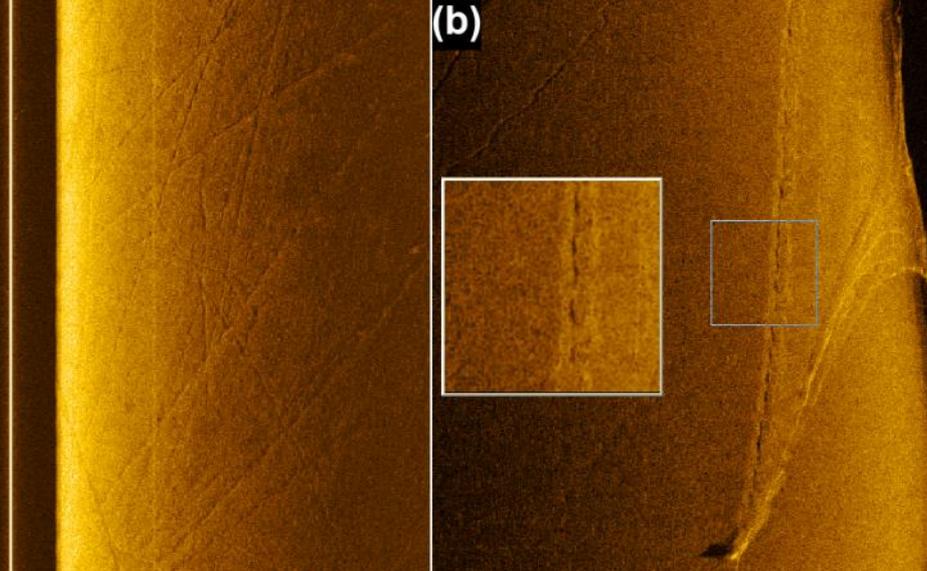

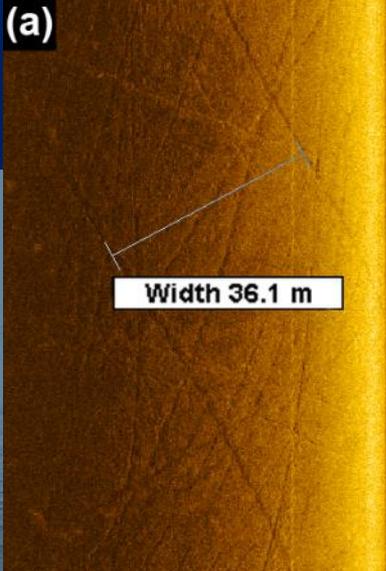

# BOTTOM TRAWL

## Anatomy of a trawl gear

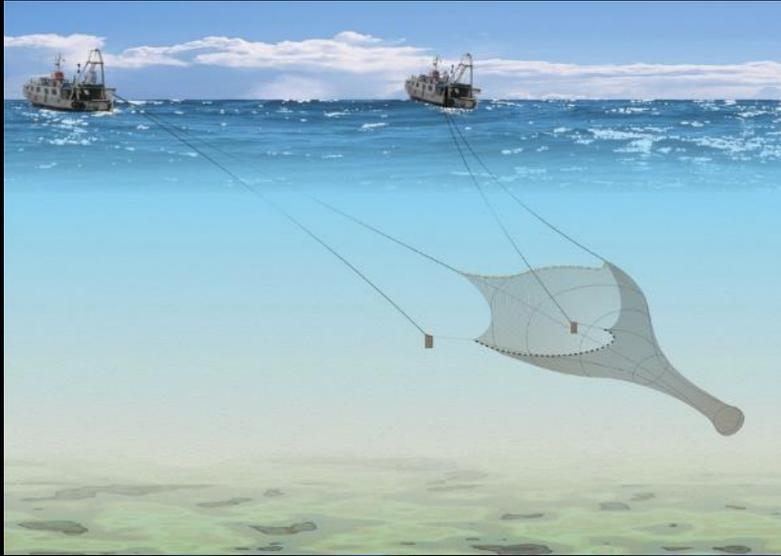

# RAPIDO TRAWL

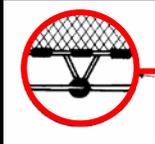

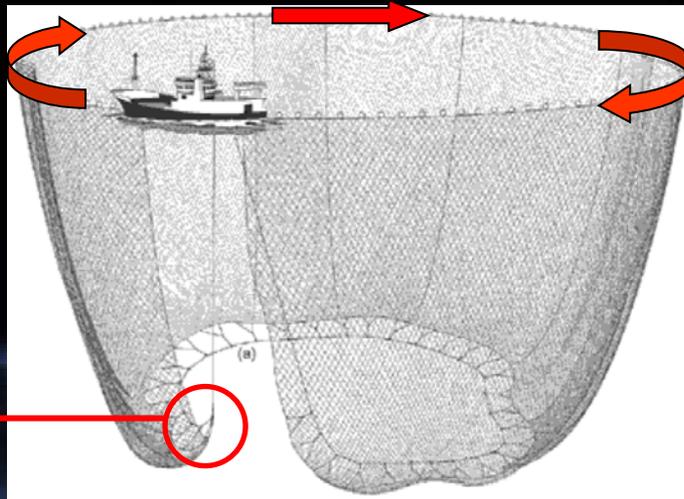

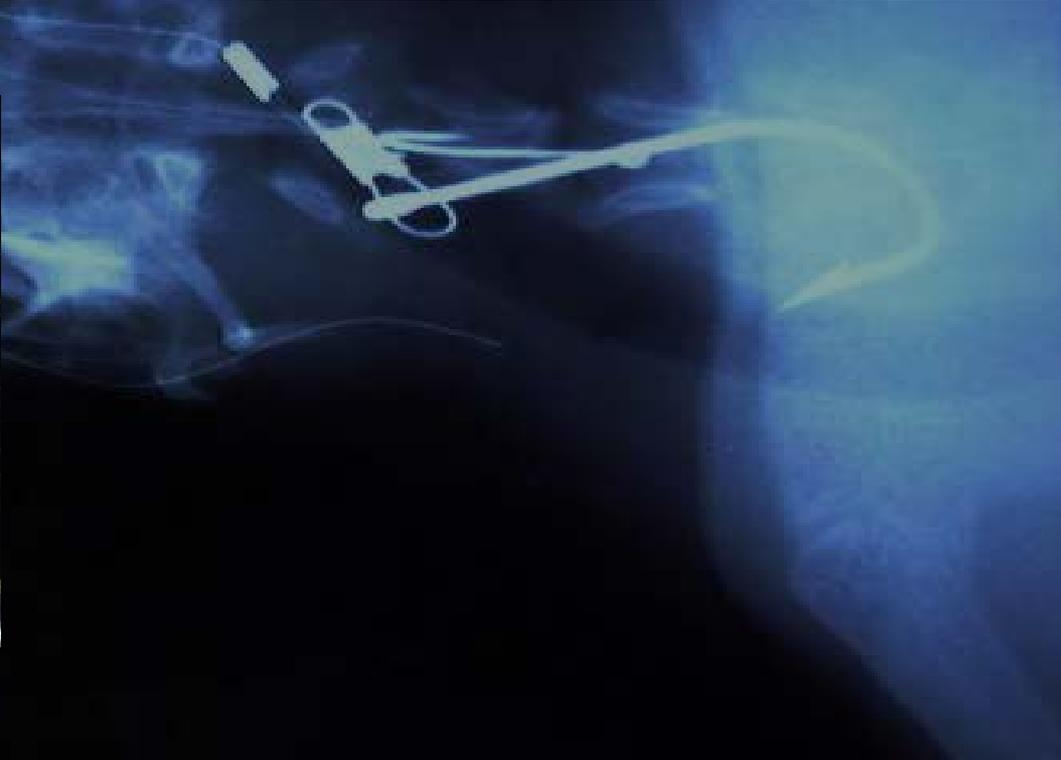

# Pelagic pair traw (PTM)

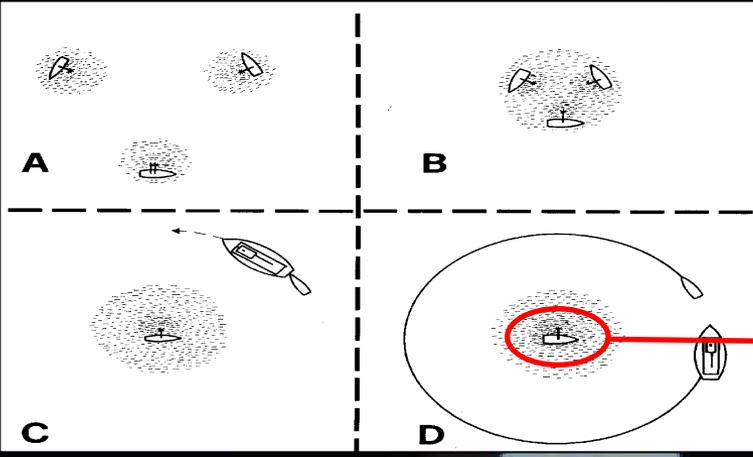

# PURSE SEINE (PS)

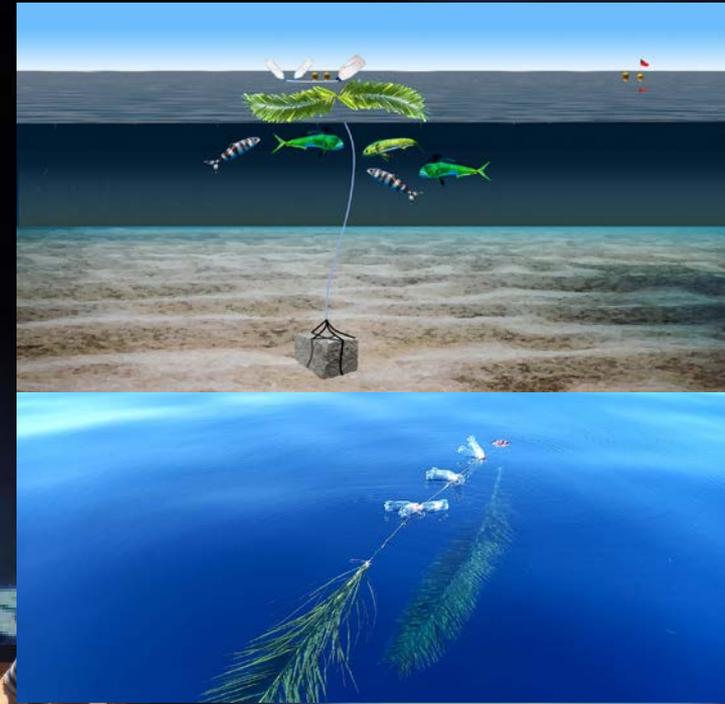

# PURSE SEINE WITH LAMPS (PS)

# FISH AGGREGATING DEVICES (FADs)

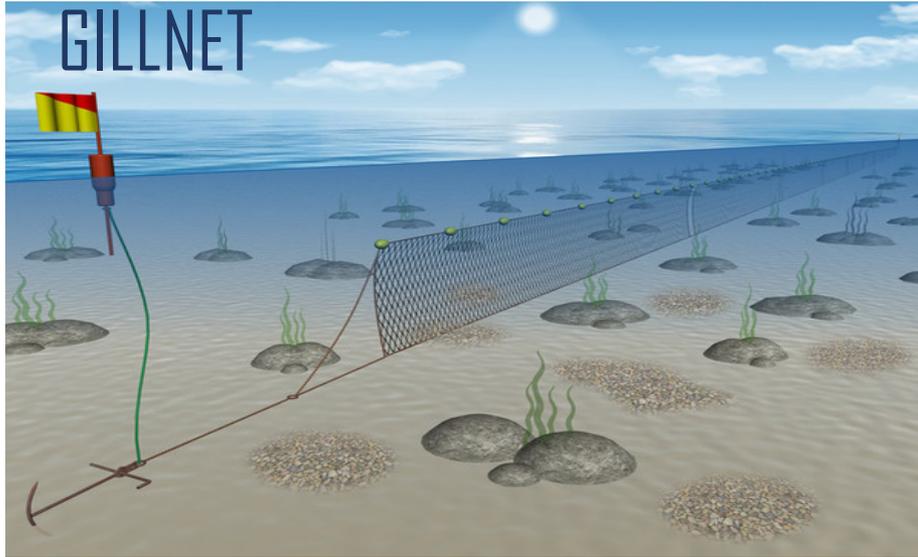

Fishing with 'cannizzati' or 'cannizzi' (especially in Sicily and Calabria), also known as 'shadow' fishing, is based on the attraction exerted on various pelagic species, which, once gathered together, are generally caught with surrounding nets. The cannizzi are usually made of palm branches tied together and held on the surface by improvised floats (empty plastic bottles and cans or polystyrene sheets). The cannizzi are connected on the bottom by a line (made of nylon or recycled material) to a weight of 8-10 kg (usually a stone or concrete artefact). Setting depths vary from 100 to 1,500 metres. At certain times of the year, many species such as amberjacks (*Seriola dumerili*), dolphinfish (*Coryphaena hippurus*), pilot fish (*Naucrates ductor*) and bonito (*Sarda sarda*) find refuge under the cannizzi, making them extremely vulnerable to fishing, especially with small surrounding nets.

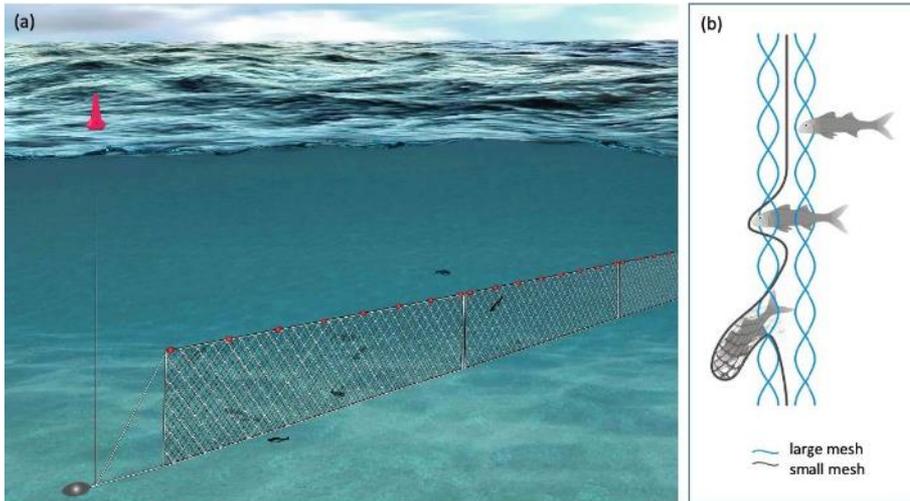

Each vessel sets from  
20 to 100 FADs

Around 700 vessels  
in the MED

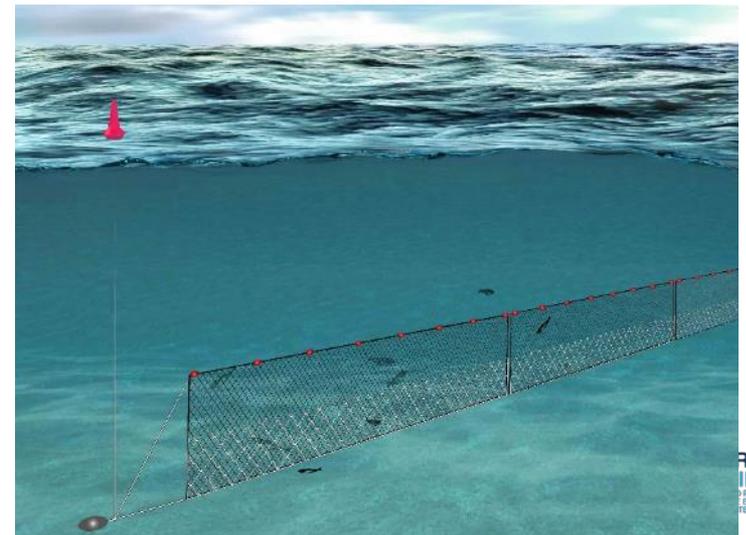

# SET NETS

## TRAMMEL NET

## COMBINED NET

# SMALL DRIFTING NETS (LEGAL)

The ferrettare are the only drift nets allowed in Italy. They are gillnets (a single piece of net), generally made of polyamide twine with a knot; they are not anchored to the bottom and can be dropped in midwater or with a headrope on the surface.

They are mainly used in Sicily, Calabria, Campania, Lazio and Liguria. They are banned in Sardinia. When fishing, they can "drift" even over a mile.

## Data collection

Collection of data on the incidental catch of vulnerable species (e.g. quantities, sizes, locations, fishing gear and timing of such bycatch)

- 
- is key in understanding the **nature and extent of this problem**
  - Identify **hot-spots areas and periods** (geographical or seasonal trend)
  - **which fishing gear** are most damaging for a given species
  - Which technical features of a gear can be modified or which **BRD** can be used
  - improve **knowledge** on biology and ecology of these species

**Adopt management measures for reducing interaction**

# Closed areas-seasons?

## Data collection

SOURCE OF DATA

**Fishery-dependent data:** data are obtained from commercial fisheries.

**Fishery-independent data:** data are obtained from scientific surveys and ad hoc monitoring programmes

## BYCATCH RISK INDICATOR

Around 200 Species (from ICES and GFCM lists)

### PRODUCTIVITY

Elasmobranchs  
Marine mammals  
Seabirds  
Sea turtles

### SUSCEPTIBILITY

- Areal overlap
- Vertical overlap
- Selectivity
- Post-capture mortality
- Bycatch
- IUCN

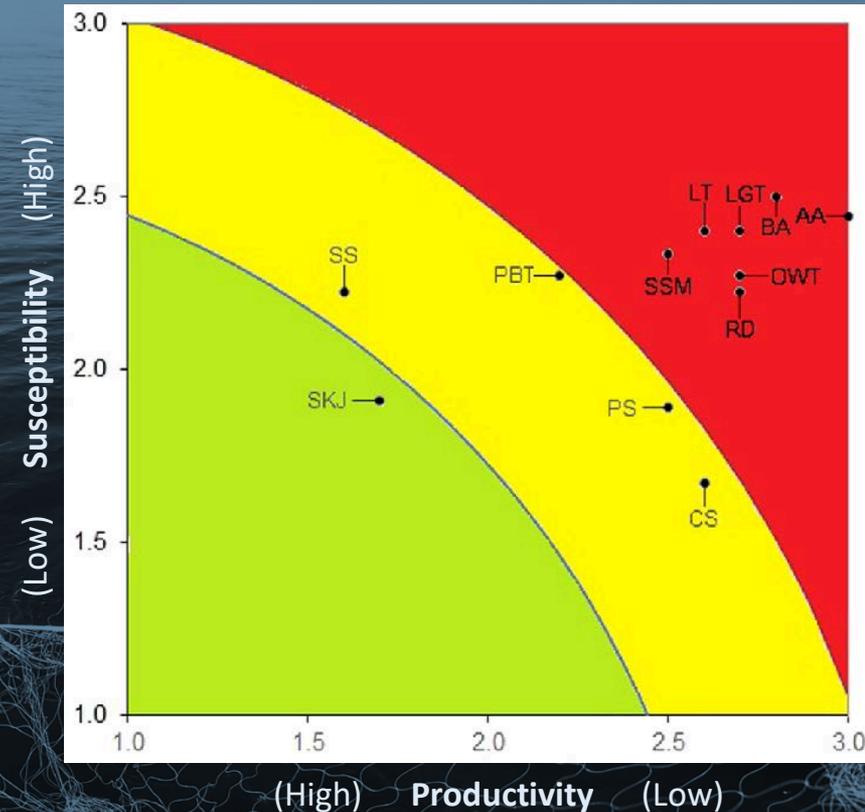

### VULNERABILITY

# PSA – Risk assessment

## Productivity and Susceptibility Analysis (PSA)

- A semi-quantitative method used within the framework of Ecological Risk Assessment (ERA) to evaluate the relative vulnerability of marine species to fishing activities.
- To estimate the potential **vulnerability** of a species, it integrates species-specific attributes of biological **productivity** (e.g., growth rate, fecundity, lifespan) with **susceptibility** indicators (e.g., likelihood of capture, post-capture mortality, spatial overlap with fisheries)

$$\text{Vulnerability (V)} = \sqrt{P_T^2 + S_T^2}$$

low risk ( $V < 2.64$ )

moderate risk ( $2.64 < V < 3.18$ )

high risk ( $V > 3.18$ )

# PSA - Risk assessment

## Susceptibility

Susceptibility attribute	Scores		
	Low (1)	Moderate (2)	High (3)
<b>Areal overlap (Availability)</b>	<10% overlap	10-30% overlap	>30% overlap
<b>Encounterability</b>	Low overlap with fishing gear (low encounter rate)	Medium overlap with fishing gear	High overlap with fishing gear (high encounter rate)
<b>Selectivity of gear type:</b>	If encountered, individuals are rarely (i.e., in less than 5% of deployments) caught / impacted.	If encountered, individuals are regularly (i.e., in 5–50% of deployments) caught / impacted.	If encountered, individuals are regularly (i.e., in 5–50% of deployments) caught / impacted.
<b>Post-capture mortality (PCM)</b>	Evidence of majority released alive post capture and survival. >66% of animals are returned alive and survive the encounter. If observers can verify that 66% are released alive in combination with a high risk score for selectivity, the team may reduce the PCM score to a low risk score (1).	Evidence of some released alive post capture and survival. 33–66% of animals are returned alive and survive the encounter. If observers can verify that 33–66% are released alive in combination with a high risk score for selectivity, the team may reduce the PCM score to a medium risk score (2).	Retained species or majority dead or low probability of survival when released.

# PSA – Risk assessment

## SUSCEPTIBILITY

- Areal overlap
- Vertical overlap
- Selectivity
- Post-capture mortality
- Bycatch
- IUCN

Calculated by combining FDI data with spatial (from AquaMaps) or vertical distribution information at species level

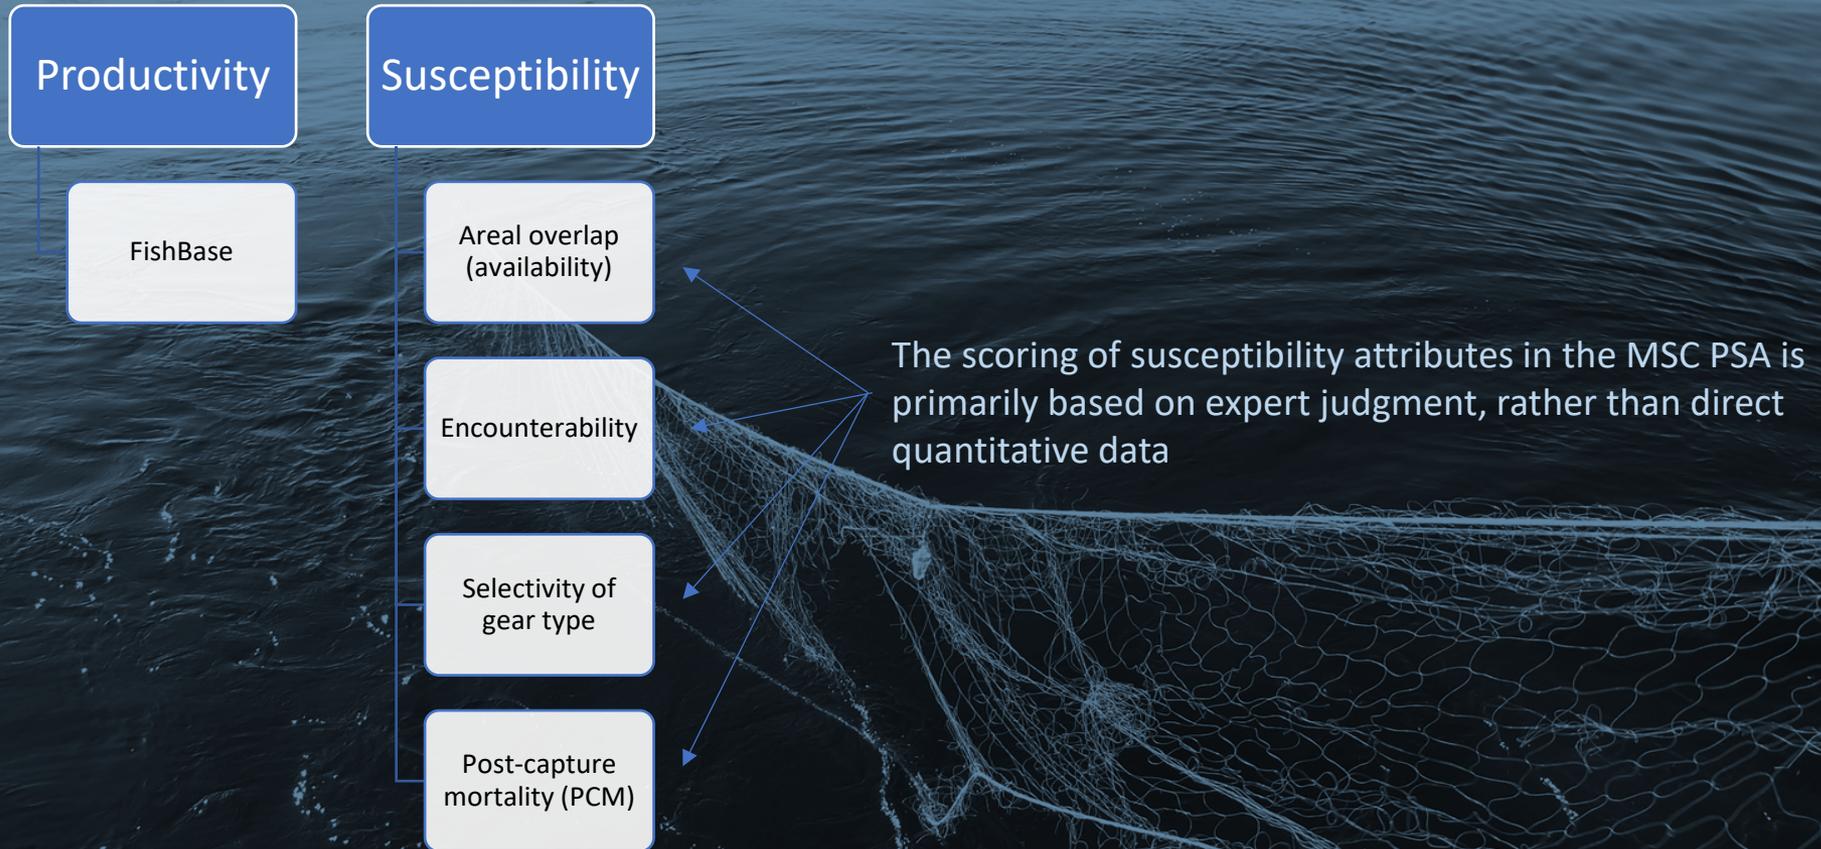

Expert judgment at species level (unchanged across years and area)

Attributes developed ad hoc for the present study

- IUCN: assessment considered at the species level across the entire study period.
- Bycatch: based on species-specific bycatch rates reported in ICES WGBYC reports for the period 2018–2023.

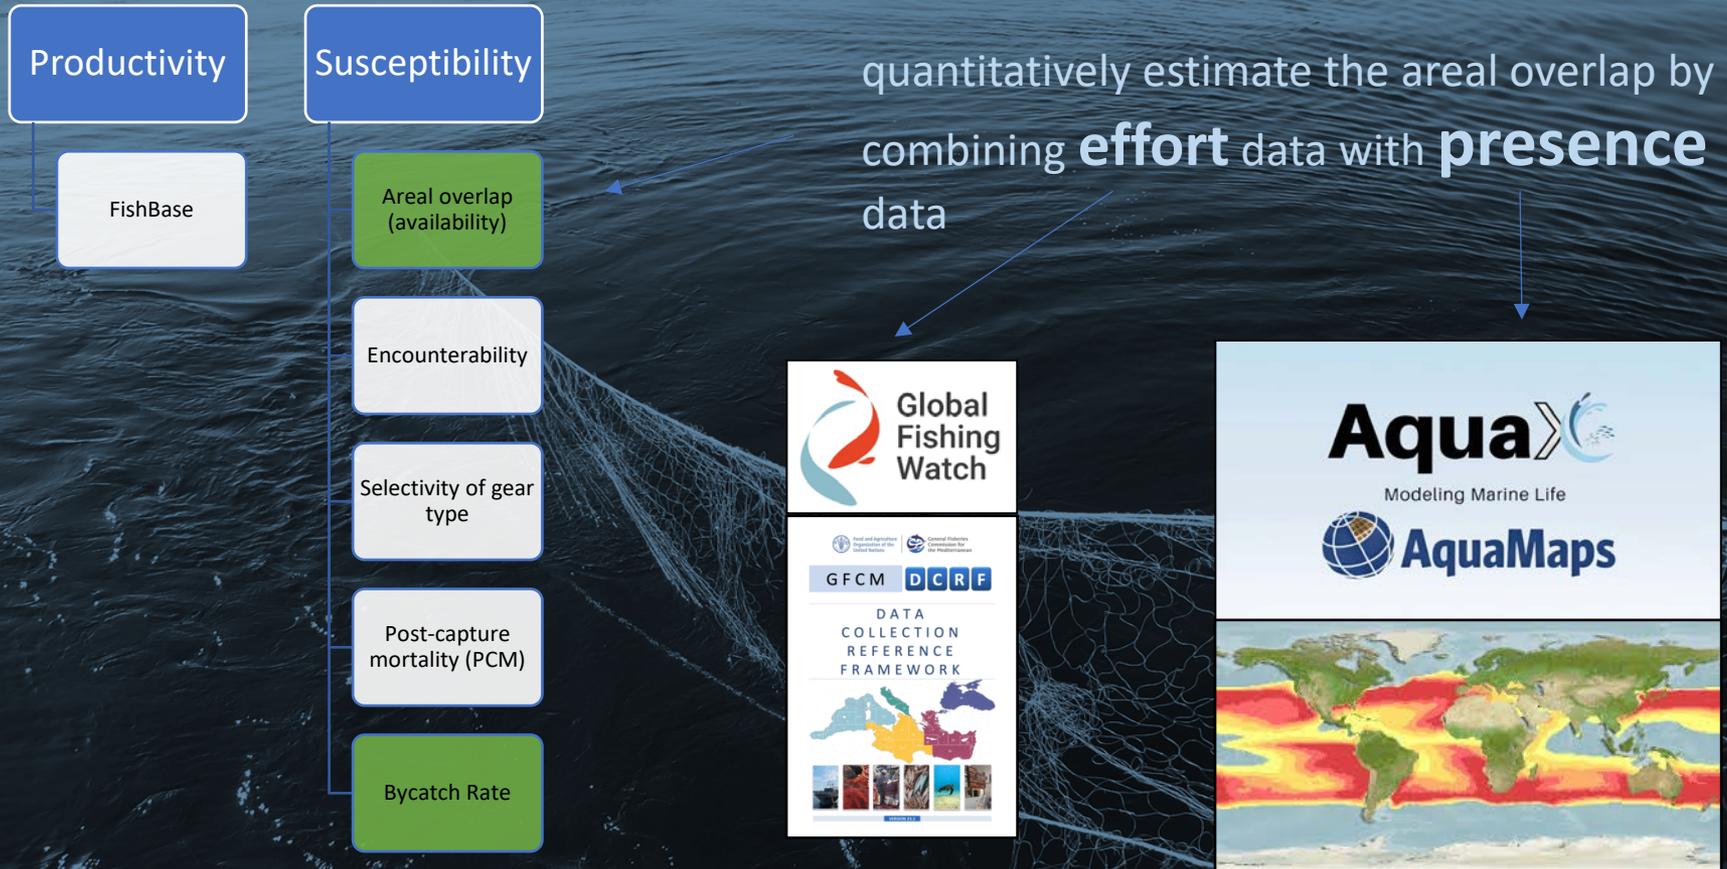

# PSA – Risk assessment

<b>Areal overlap (Availability)<sup>1</sup></b> Overlap of the fishing effort and the species group distribution	<10% overlap	10-30% overlap	>30% overlap

# PSA – Risk assessment

## Vertical overlap

- Species depth ranges were compiled through a dedicated literature review.
- For each spatial cell, bathymetric information (mean depth and variability) was derived from GEBCO data.
- The depth distribution within each cell was approximated to represent vertical heterogeneity.

For each species and fishing gear, vertical overlap was estimated as the probability that:

- the species occurs within the cell's depth range, and
- the gear operates within the same depth range.
- Bottom-contact gears were modeled as interacting with species close to the seabed (up to 800 m depth).

Continuous overlap values (0–1) were converted into ordinal susceptibility ranks (0–3).

Cells with no overlap (rank 0) were excluded from vulnerability calculations.

Susceptibility attribute	Scores		
	Low (1)	Moderate (2)	High (3)
<b>Vertical overlap (Encounterability)<sup>2</sup></b> The position of the species group within the water column relative to the fishing gear	Low vertical overlap with fishing gear (<25% of species depth range)	Moderate vertical overlap with fishing gear (25–50% of species depth range)	High vertical overlap with fishing gear (>50% of species depth range)

# PSA – Risk assessment

## BYCATCH - 93 species

- Bycatch rate defined as the number of individuals incidentally caught per unit of monitored fishing effort (Days at Sea, DAS).
- Data derived from ICES WGBYC reports (2018–2023).
  - 2017 assumed equal to 2018
  - 2024 assumed equal to 2023
- Longlines treated separately as:
  - Pelagic (drifting)
  - Demersal (bottom-set)
- Data cleaning:
  - Removal of missing or non-plausible values
  - Exclusion of extreme values (>95th percentile)
  - Same trimming applied to derived total bycatch estimates
- Cleaned bycatch rates were classified into three species-specific classes (tertiles):
  - 1 = Low
  - 2 = Medium
  - 3 = High

Susceptibility attribute	Scores		
	Low (1)	Moderate (2)	High (3)
<b>Bycatch rate</b> Individuals accidentally caught per days at sea	By-catch rate $\leq$ first tertile (33rd percentile) of the species-specific distribution across the study area.	By-catch rate $>$ first tertile and $\leq$ second tertile (66th percentile) of the species-specific distribution across the study area	By-catch rate $>$ second tertile (66th percentile) of the species-specific distribution across the study area.

# PBR: Potential Biological Removal

- An upper limit to the level of mortality that would allow a stock to achieve abundance  $\geq$  the Maximum Net Productivity Level (MNPL)
- A stock whose abundance is at or above MNPL is referred to as being at “Optimum Sustainable Population” (OSP).
  - A goal of the Management of protected species
  - Assessing stock status relative to OSP is challenging because that determination rests on the ability to estimate abundance relative to K.
- Estimating bycatch and keeping it below PBR is analytically more feasible, more precise, and a more direct way of managing marine mammal stocks and ensuring that they reach/are maintained at OSP.

# PBR: Potential Biological Removal

$$\text{PBR} = N_{\min} \cdot 1/2 R_{\max} \cdot F_R \quad \text{Marine mammals}$$

Year	$N_{\text{best}}$	$\text{CV}(N_{\text{best}})$	$N_{\min}$	$R_{\max}$	$F_r$	PBR	ZMRG
1991	37,500	0.29	--	--		--	
1992	67,500	0.23	40,297*	0.040	0.5	403	40

2021 DRAFT	85,765	0.53	56,420	0.046 <sup>2</sup>	0.5	649	65

$N_{\min}$  = Minimum population size

$R_{\max}$  = Maximum net productivity rate

- Default = 0.04 = Minimum population size

$F_R$  = Recovery factor

- Default = 0.5 for depleted and threatened stocks and stocks of unknown status
- Default = 0.1 for endangered stocks

ZMRG = Zero Mortality Rate Goal • 10% of PBR

## $F_R$ : Recovery Factor

- Used as a conservative buffer against various plausible biases or assumption violations
- Range: 0.1 – 1.0
  - Default = 0.5
  - = 0.1 – 0.3 for Endangered Species (depending on estimated abundance)

# PBR: Potential Biological Removal

How is abundance ( $N_{min}$ ) estimated?

- Aerial surveys and distance sampling methods (harbor porpoises) or pup counts (pinnipeds)
- Small-boat surveys and markrecapture methods (coastal bottlenose Dolphins, blue whales)
- Shore-based surveys (gray whales)

# PBR: Potential Biological Removal

## Sperm whale

$$PBR = 0.5 R_{\max} N_{\min} F_R$$

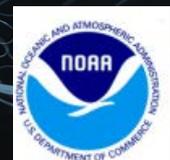

$$PBR = 0.5 (0.04) N_{\min} (0.1)$$

Conventional approach:  $N_{\min}$  based on average estimate of abundance from two most recent surveys

Year	N	$N_{\min}$
2005	3140 (CV = 0.4)	
2008	300 (CV = 0.51)	
Average	971 (CV = 0.31)	751

Based on NOAA

# PBR: Potential Biological Removal

## Sperm whale

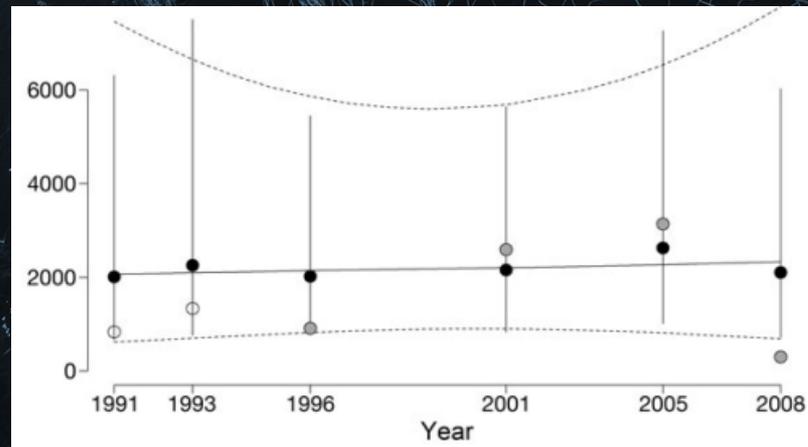

$$PBR = 0.5 R_{\max} N_{\min} F_R$$

$$PBR = 0.5 (0.04) N_{\min} (0.1)$$

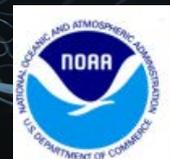

Model-based approach:  $N_{\min}$  based on estimates of abundance from all previous surveys and Bayesian methods

$$N_{\min}(2008) = 1332$$

Based on NOAA

# PBR: Potential Biological Removal

## Sperm whale

$$PBR = 0.5 R_{\max} N_{\min} F_R$$

$$PBR = 0.5 (0.04) N_{\min} (0.1)$$

Model-based approach:  $N_{\min}$  based on estimates of abundance from all previous surveys and Bayesian methods

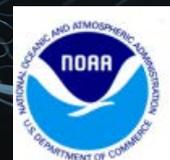

Conventional Approach

$$PBR = 0.5 (0.04) (751) (0.1) = 1.5$$

Model-based Approach

$$PBR = 0.5 (0.04) (1332) (0.1) = 2.7$$

Based on NOAA

# PBR: Potential Biological Removal

## Sperm whale

### Estimating bycatch and comparing to PBR

- Annual bycatch estimates are variable
- Pooling bycatch estimates across multiple years provides a more precise measure (especially for species caught infrequently).

### Estimated bycatch for the drift gillnet fishery

Year	Observer coverage %	Observed M&SI	Estimated M&SI
2006	19%	0	0
2007	16%	0	0
2008	14%	0	0
2009	13%	0	0
2010	12%	2	16
Average			3.8

$$\begin{aligned} \text{PBR} &= 0.5 R_{\max} N_{\min} F_R \\ &= 2.7 \\ &\text{(model-based approach)} \end{aligned}$$

Based on NOAA

# PBR: Potential Biological Removal

Sperm whale

## Estimating bycatch and comparing to PBR

- Annual bycatch estimates are variable
- Pooling bycatch estimates across multiple years provides a more precise measure (especially for species caught infrequently).

Unsustainable: When annual human-caused mortality/serious injuries exceed the PBR

**Bycatch/PBR > 1**

Although the "formal" threshold is  $PBR = 1$ , the aim is often to stay well below it (uncertainty buffer). In the US MMPA context, the long-term goal is often to reduce it to "insignificant" levels (approximately ~10% of the PBR).

Based on NOAA

# Prohibited gear?

Illegal driftnets targeting swordfish (spadara nets) are still a matter of concern

Illegal since 1998: Council Regulation (EC) No 894/97 of April 29th 1997, amended by Council Reg. no. 1239/98 e Council Reg. no. 809/2007

# Marine mammals

Fisheries → Mammals	Mammals → Fisheries
Entanglement	<b>Steal fish</b> from the nets, sometimes in a highly selective manner, directly causing commercial losses
Injuries to mammals due to impacts with fishing gears	<b>Damage and spoil fish</b> already caught in the nets which, being mutilated, is often no longer tradable
Reduce their critical habitat	<b>Damage the nets</b> , that need to be repaired or new ones to be purchased
Reduce availability of their prey	As indirect economic loss, scare the schools of fish, <b>reducing the catch rates</b> ; the time spent by fishermen to manage the interactions with dolphins causes a reduction in time spent on fishing activities
Ingestion of nets with lethal consequences	<b>Remove baits</b> from hooks of longlines
Voluntary injuries	

**Interactions dolphins-fishing activity is an environmental, economic and social concern!**

# Marine mammals

Interactions between marine mammals and fisheries in the Mediterranean and the Black Sea involve the following species:

common bottlenose dolphins (*Tursiops truncatus*)

striped dolphin (*Stenella coeruleoalba*)

common dolphins (*Delphinus delphis*)

monk seals (*Monachus monachus*)

killer whales (*Orcinus orca*)

Morocco

harbour porpoise (*Phocoena phocoena relicta*)

Black Sea

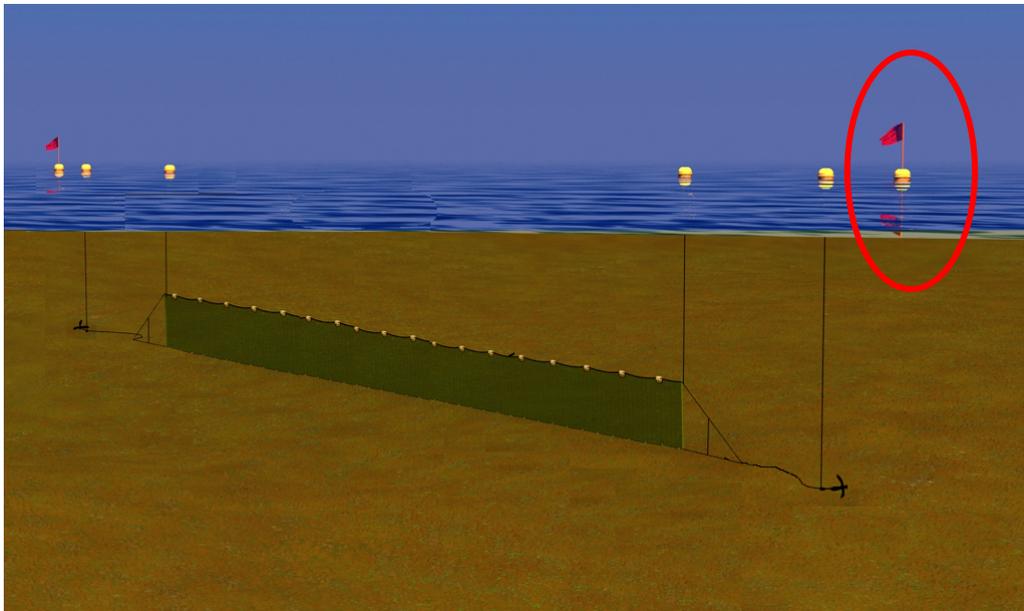

# Marine mammals

Interactions between marine mammals and fisheries in the Mediterranean and the Black Sea involve mainly coastal fisheries

**Passive nets (gillnets and trammel nest) are the main threat**

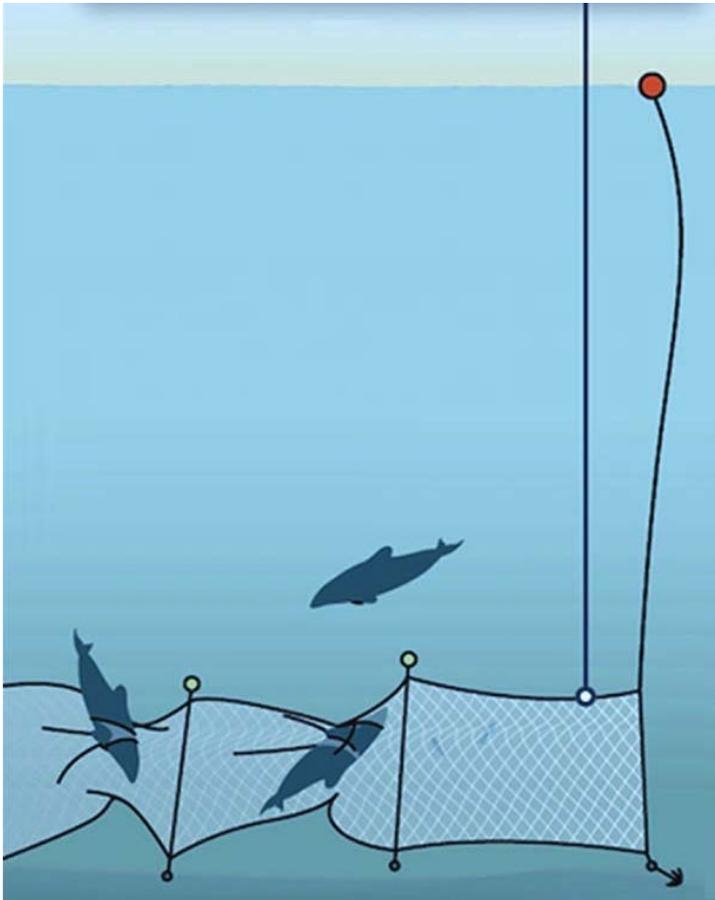

# Marine mammals

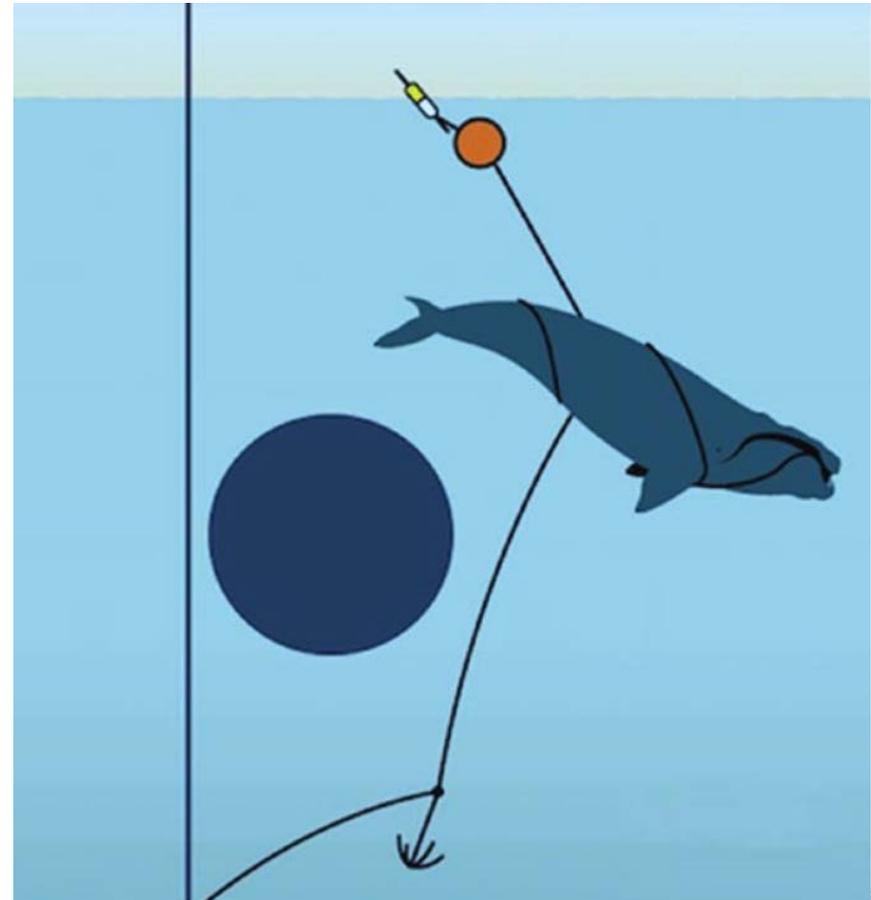

## Passive nets (gillnets and trammel nest)

Fish Aggregating Device

# Marine mammals

## Purse seine

### Fish Aggregating Device, in Italy: Cannizzi

Each vessel sets from  
20 to 100 FADs

Around 700 vessels  
in the MED

# Sea turtles

Sea turtles can be affected at all life stages by anthropogenic factors: from eggs (destruction-modification of the nesting beaches) to young and adults (including fishing operations). As a result, all sea turtle species are subjects of conservation concern

## Most of fishing gears involved

Fisheries → Turtles	Mammals → Fisheries
Entanglement	<b>Steal fish</b> from baited hooks reducing catch efficiency
Injuries to turtles due to impacts with fishing gears especially trawling	<b>Loss of time to disentangle</b>
Ingestion of hooks with lethal consequences	Damage to fishing nets
Voluntary injuries	

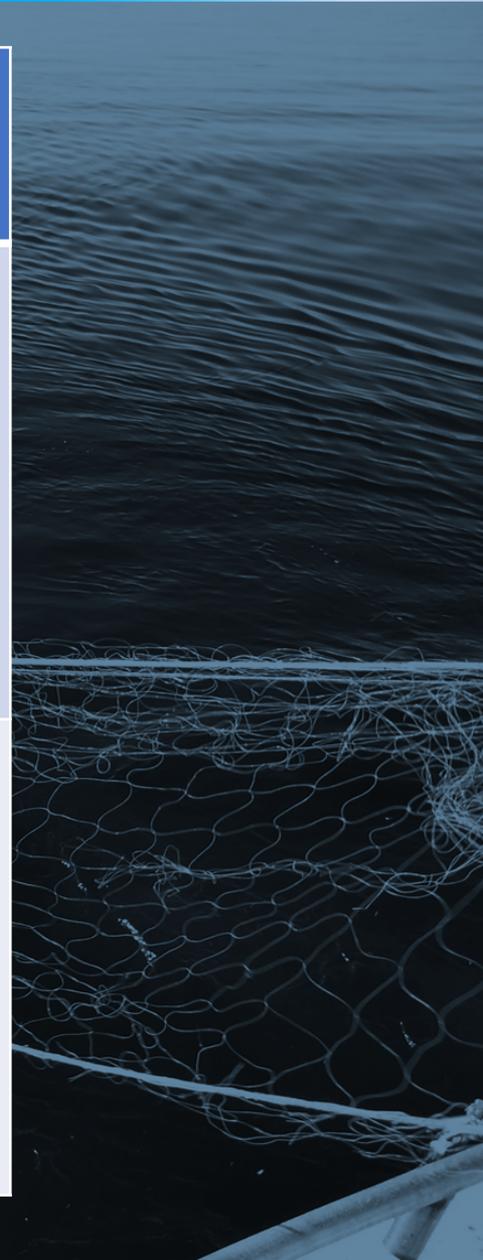

# Sea turtles

Interactions between turtles and fisheries in the Mediterranean and the Black Sea involve the following species:

Loggerhead turtle (*Caretta caretta*)

Green sea turtle (*Chelonia mydas*)

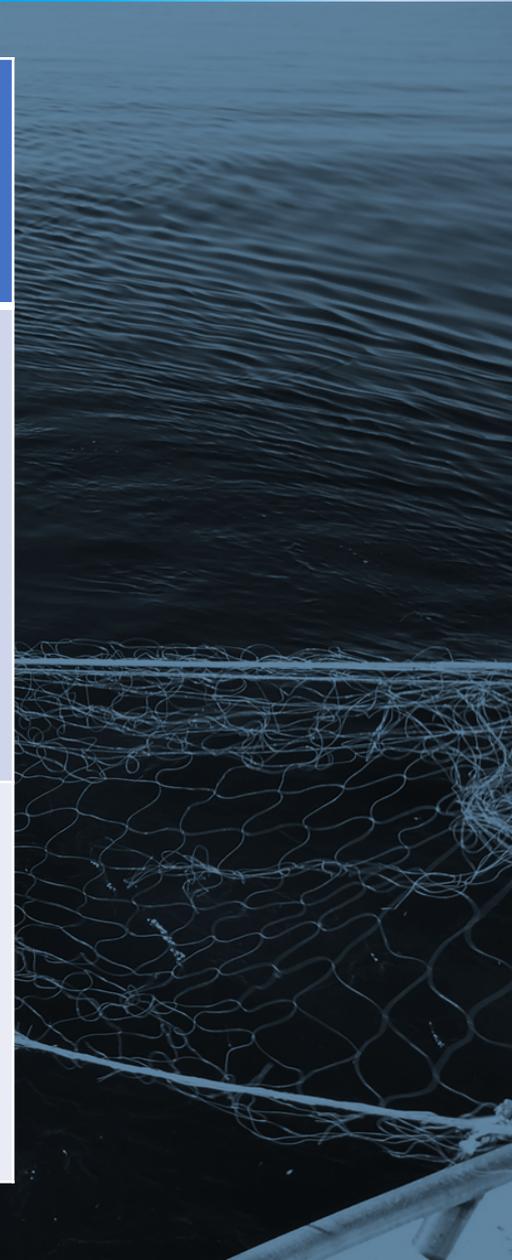

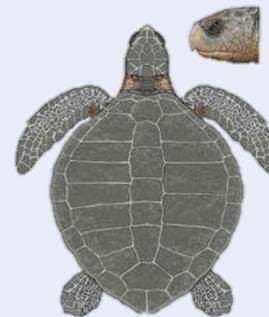

# Sea turtles

Interactions between turtles and fisheries in the Mediterranean and the Black Sea RARELY involve the following species:

Leatherback turtle (*Dermochelys coriacea*)

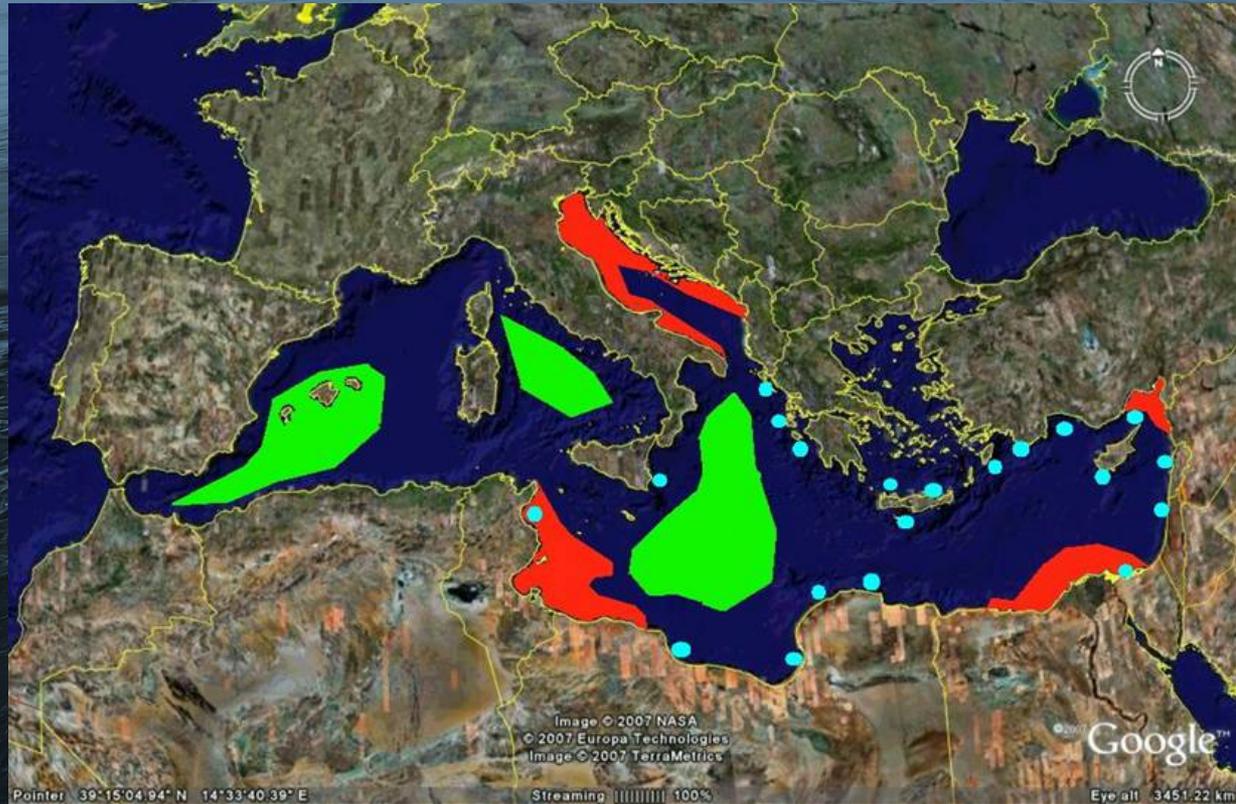

Olive ridley turtle (*Lepidochelys olivacea*)

# Sea turtles

## Fisheries affect different ecological phases of sea turtles

*Caretta caretta*

PELAGIC HABITATS (PELAGIC PHASE)

BOTTOM HABITATS (DEMERSAL PHASE)

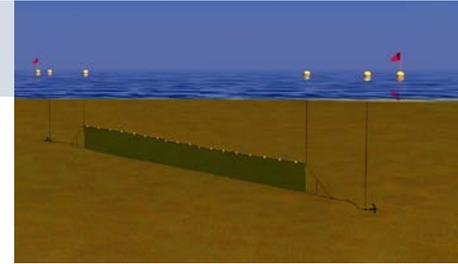

MAIN SPAWNING AREAS

# Sea turtles

## Passive nets (gillnets and trammel nest)

- Interactions between sea turtles and passive nets is a matter of concern because of high direct mortality due to drowning
- Most of interactions occur when turtles try to feed on preys already caught by nets (depredation)

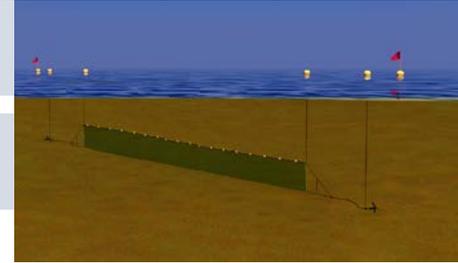

# Sea turtles

## Passive nets (gillnets and trammel net)

## Parameters affecting sea turtle bycatch

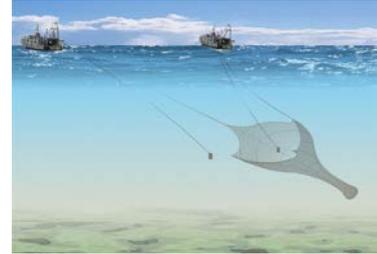

- Mesh size: the larger mesh size the higher is the probability of bycatch
- Trammel net more dangerous than gillnet
- Hanging ratio: nets with a high slack
- Net height
- Soak time
- Bottom depth
- Habitat: e.g. south river Po, north Adriatic
- Buoys

# Sea turtles

## Trawling (bottom and pelagic trawling)

Interactions between sea turtles and bottom trawling occur especially in neritic habitats (shallow waters) when turtles feed on prey on the bottom

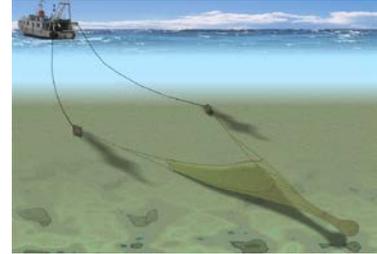

## Pelagic trawling

# Sea turtles

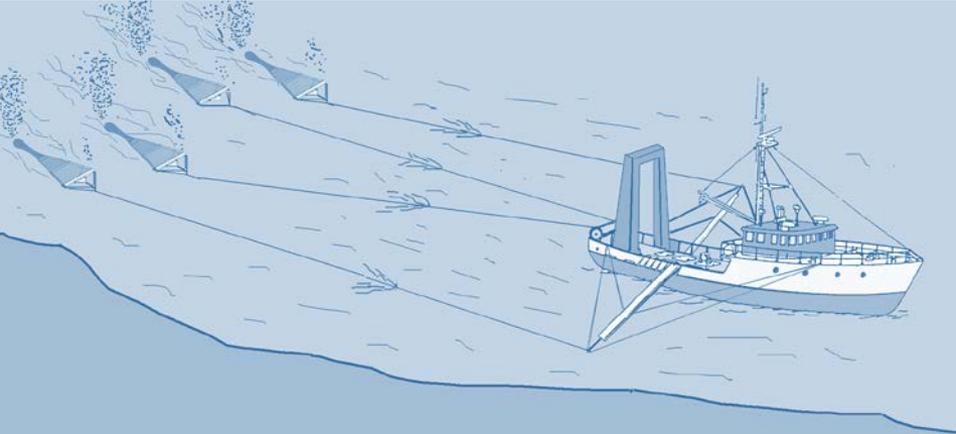

## Bottom trawling

Interactions between sea turtles and bottom trawling occur especially in neritic habitats (shallow waters) when turtles feed on prey on the bottom

# Sea turtles

## Rapido trawling

It's a kind of beam trawl targeting common sole

# Sea turtles

## Rapido trawling

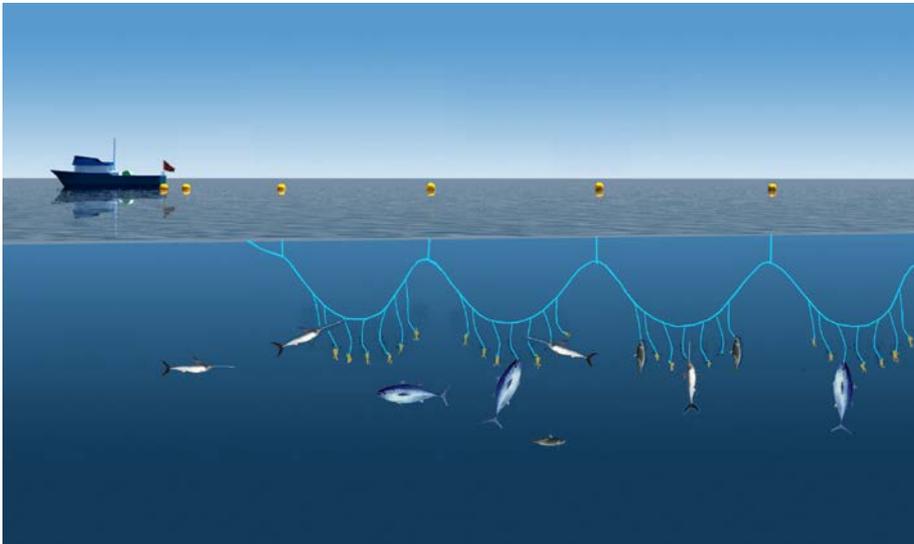

# Sea turtles

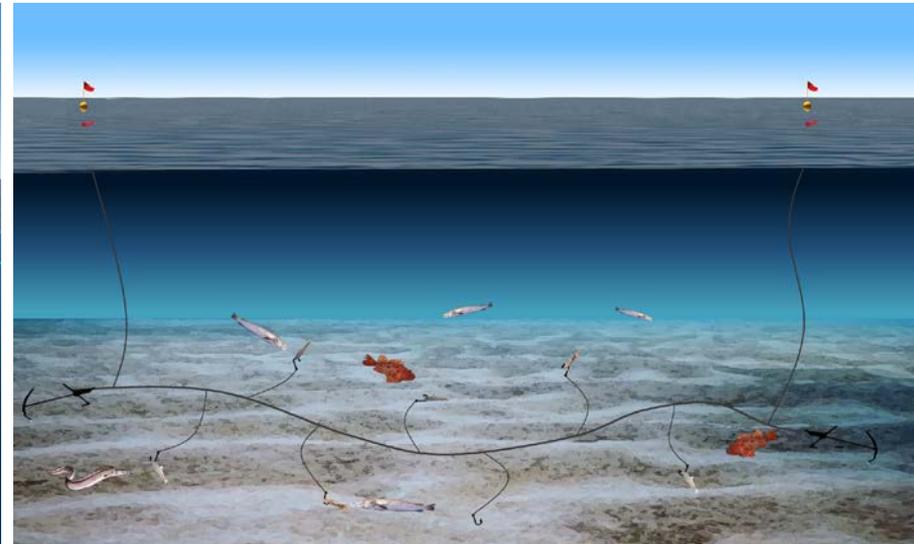

## Longlines

- Interactions between sea turtles and longlines mainly occur when turtles try to feed on the bait on hooks
- Turtles can also get tangled on the main line or in the branchlines
- Thousand of hooks up to 60 km in length

### Surface or drifting longline

### Bottom longline

# Sea turtles

## Drifting Longlines

# Sea turtles

## Longlines

### Parameters affecting sea turtle bycatch

- Hook size (length, gap etc.)
- Hook shape
- Type of bait (mackerel, squid, artificial bait)
- Depth setting
- Soak time
- Branchline length

# Sharks and rays (SARs)

## Main threats

- Sharks and rays are exploited by several fishing gears (passive nets, trawling, longlines, mostly).
- Only a few species are “formally protected”
- Several species have a commercial value, some of them are a target

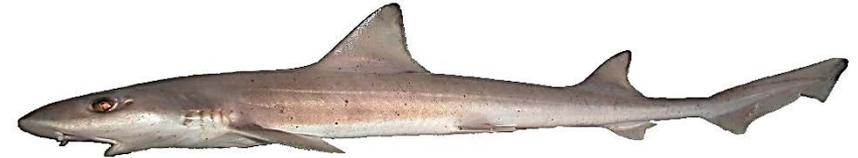

# Sharks and rays (SARs)

## Common species of sharks in fishing activities

A

Spiny dogfish (*Squalus acanthias*)

Common smooth-hound (*Mustelus mustelus*)

Small-spotted catshark (*Scyliorhinus canicula*)

Blue shark (*Prionace glauca*)

# Sharks and rays (SARs)

## Common species of rays in fishing activities

*Raja clavata*

*Raja miraletus*

*Torpedo marmorata*

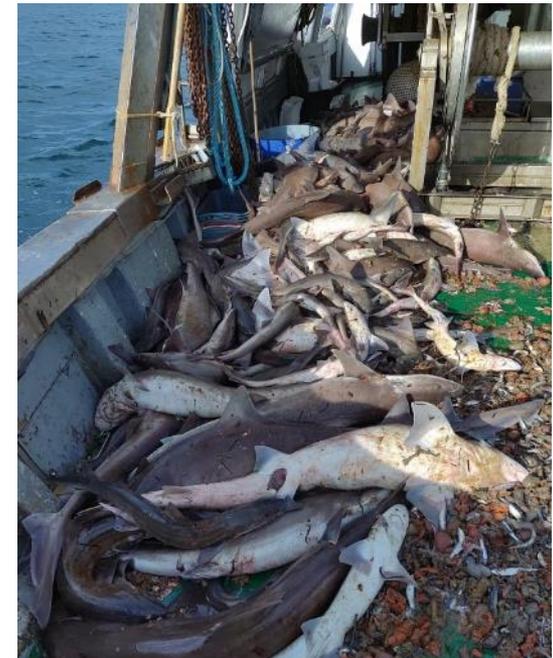

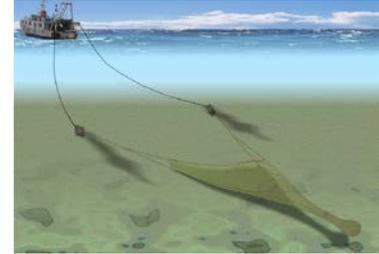

*Raja asterias*

*Myliobatis aquila*

# Sharks and rays (SARs)

## Bottom trawling

# Sharks and rays (SARs)

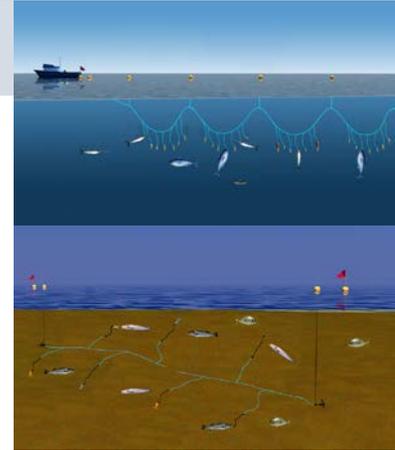

## Rapido trawling

# Sharks and rays (SARs)

## Longlines

- Interactions between sharks and rays and longlines mainly occur when SARs try to feed on the bait on hooks

## Target species: swordfish

## Bycatch species: swordfish

# Sharks and rays (SARs)

**Bottom longline**

**Target species: Sparids,  
hake, Serranids etc.**

**Bycatch species: demersal sharks**

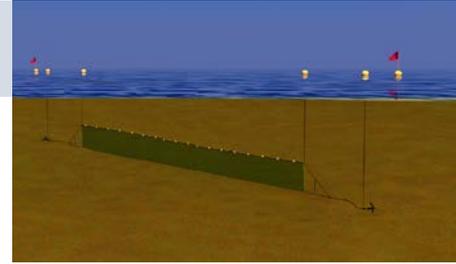

*Hexanchus griseus*

# Sharks and rays (SARs)

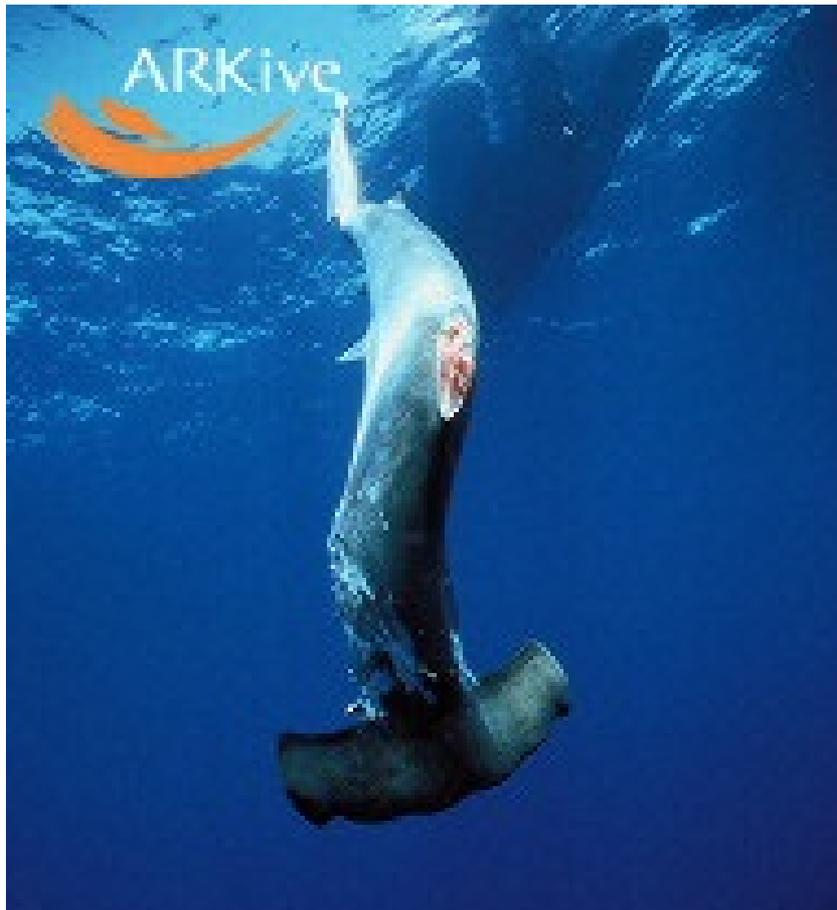

## Passive nets (gillnets and trammel nets)

Interactions between sharks and rays and passive nets targeting turbot (*Scophthalmus maximus*) and rays

# Sharks and rays

## Longlines

# Bycatch Reducing Devices (BRDs)

**Bycatch Reducer Devices – BRDs: device that aims at reducing the catch of incidental catch of unwanted species**

Two types of advanced technology can be introduced in a fisheries:

- some technology can be adopted by fishermen voluntarily – e.g. to help catch more fish – a clear short-term benefits not obvious.
- Some technologies can be introduced as management measure to ensure a fishery is sustainable (BRD). In this case fishermen may need persuasion – e.g. more selective fishing gears to reduce discards – a longer-term benefit which is not obvious.

The first may need to be controlled or at least monitored (to avoid overexploitation)

The second may need to be initiated by management

# Bycatch Reducing Devices (BRDs)

Before introducing a new technology it should take into account

- What are the problems to be solved and what are the targets (high discards of young fish (which species?), high discards of non-target species)
- Which of the possible solutions is best: a need to extend fishing to new areas, uneconomic fishing operations, new gears, modified gears etc

Experimental trials are essential in order to find out the right setup and to reduce the short term economic loss

# Bycatch Reducing Devices (BRDs)

Before introducing a new technology it should take into account: What are likely the consequences

- Environmental impact (physical impact, type of bottom impacted)
- Selectivity (juveniles conservation, fishing mortality etc.). What are consequences for each fish stock affected
- What are the consequences for the total effort applied
- Economic benefit (working time, fish quality etc.)
- Social consequences (eg number of fishermen employed)
- Time scale
- How to evaluate the results

# Bycatch Reducing Devices (BRDs)

Before introducing a new technology it should take into account: main issues

There are usually 3 issues

- the practical problem of introducing a new gear
- the immediate short-term effect on the economics of fishing (often a loss)
- and the longer term effect of a change when the stock has responded (should be a benefit of course!)

But fishermen usually do not like the long terms!!!

Stakeholders involvement: fishermen, netmakers, suppliers, scientists, enforcement officers as well as managers and the environmental bodies)

# Bycatch Reducing Devices (BRDs)

Before introducing a new technology it should take into account: new technology should be

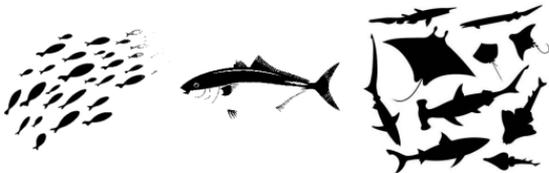

- Practical at sea (do not involve major changes to the common practices, easy to use and cheap to maintain)
- Acceptable for fishermen (Economically viable)
- Acceptable for management (achieves the management, biological targets)
- Do not pose a risk the safety of the fishing vessel crew or the bycaught animals.
- Enforceable (easy to be controlled)

# Bycatch Reducing Devices (BRDs)

# Bycatch Reducing Devices (BRDs)

## Classification of the BRDs: Modified netting

Passive nets: The use of large meshes and net slakness, strongly increase the risk of megafauna entanglement

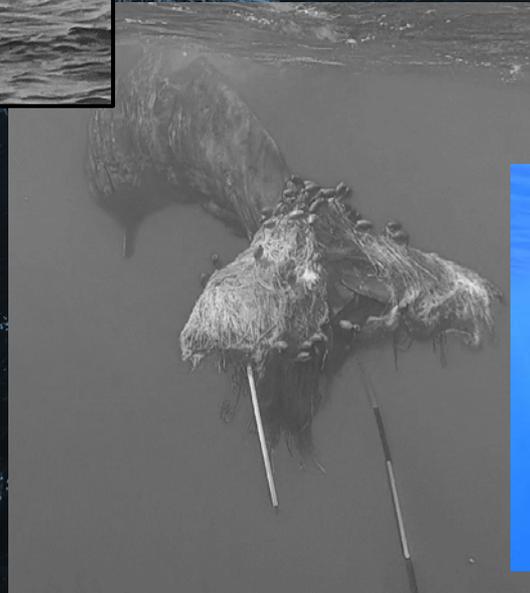

- 100 vessels are involved in the small scale driftnet fisheries in EU Mediterranean.
- The study confirm the full environmental sustainability of the small scale driftnets.
- Small meshes (70 mm) will save traditional métiers and sensitive species.
- Using twines in small driftnets makes rather unlikely the catch of marine mammals.
- Within 3 miles from the coast driftnet-sensitive species interactions reduce.

# Bycatch Reducing Devices (BRDs)

## Classification of the BRDs: Modified netting

Passive nets: The use of large meshes and net slakness, strongly increase the risk of megafauna entanglement

# Bycatch Reducing Devices (BRDs)

## Classification of the BRDs: Modified netting

Passive nets: The use of large meshes and net slakness, strongly increase the risk of megafauna entanglement

In the case of fixed gillnets, the low hanging ratio increases the slack of netting panels, enabling gillnets to catch marine organisms also by entangling them, which does not happen frequently with driftnets.

Possible management strategies to reduce bycatch include technical modification to gear setting (such as reducing netting slack and using small meshes), bycatch reducer devices (such as LED UV), and area and seasonal gear restrictions to small-scale fisheries in areas of greatest concern in the northern Adriatic Sea

### Flexible Turtle Excluder Device (TED): an effective tool for Mediterranean coastal multispecies bottom trawl fisheries

Alessandro LUCCHETTI\*, Elisa PUNZO and Massimo VIRGILI

National Research Council (CNR), Institute of Marine Sciences (ISMAR) of Ancona (Italy), Largo Fiera della Pesca 1, 60125 Ancona, Italy

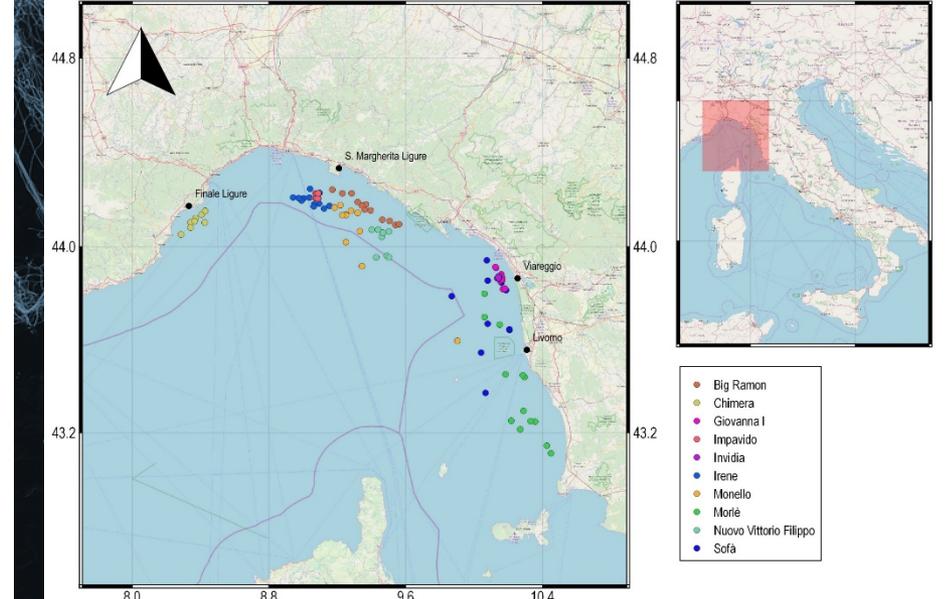

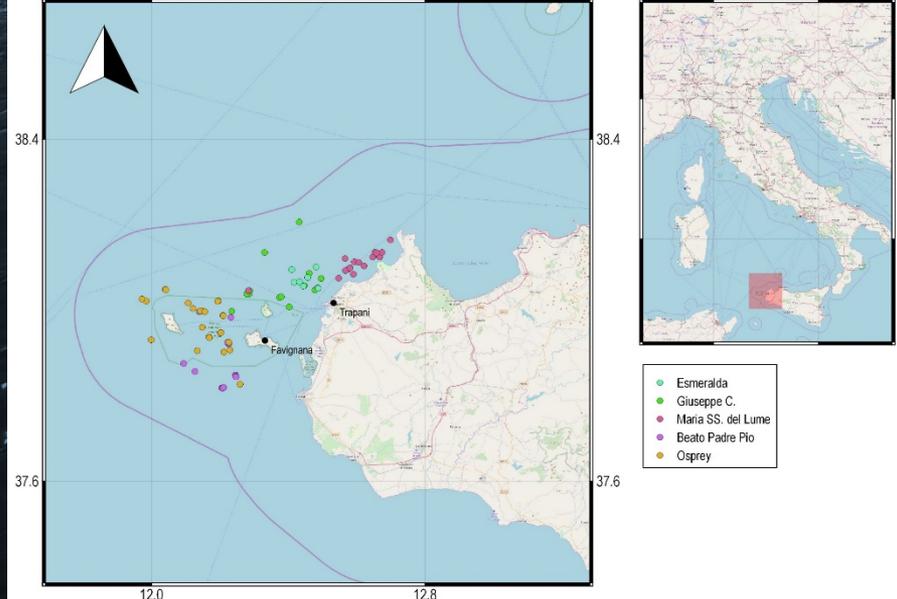

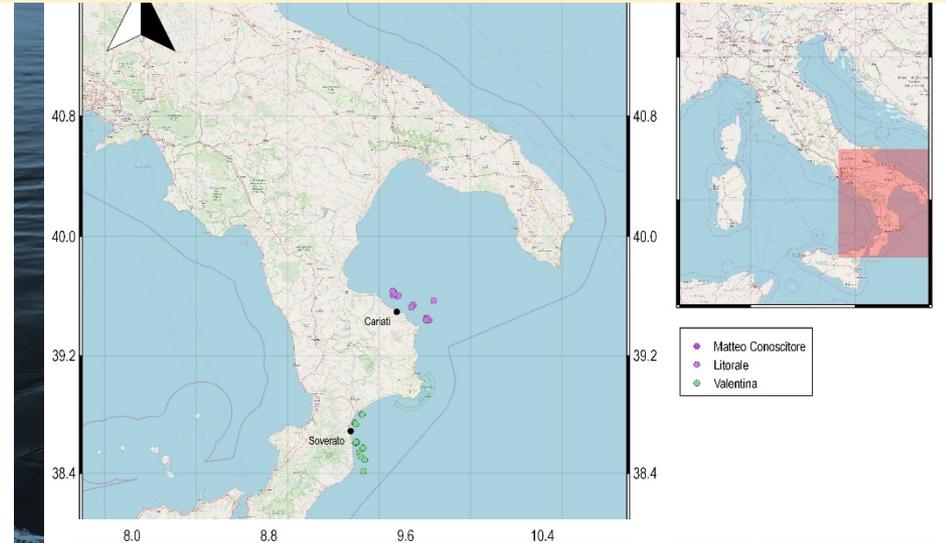

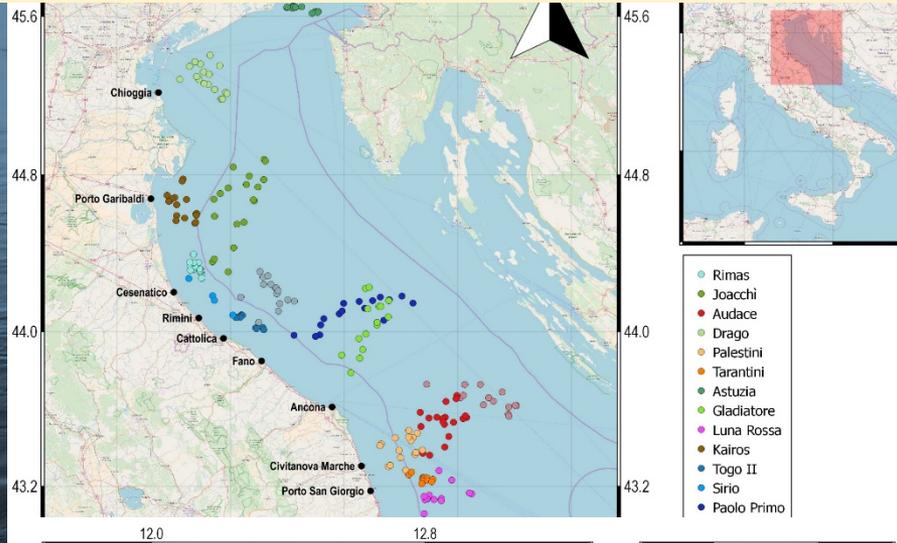

Received 15 January 2016; Accepted 18 April 2016

**Abstract** – The effect of a flexible Turtle Excluder Device (TED) on the catching efficiency and performance of a commercial bottom trawl was tested in a gear comparison study for a Mediterranean coastal multispecies bottom trawl fishery. The device affected neither bottom trawl technical performances (horizontal and vertical net opening and door spread) nor did it increase the required towing force, hence fuel consumption remained constant. Comparison of commercial catches for the major species demonstrated that using the TED did not affect catching efficiency, while it reduced the amount of debris. The device did not influence the size of commercial species, leaving the selective performance of the trawl unmodified. Underwater video camera recordings documented that fish caught in the net swam through the grid and easily reached the cod-end, missing the TED escape opening. Easy storage and improved catch retention compared with previous devices tested in this area make the present flexible TED a practical and valuable solution to reduce turtle bycatch in coastal Mediterranean demersal multispecies fisheries.

### Reducing Sea Turtle Bycatch in the Mediterranean Mixed Demersal Fisheries

Alessandro Lucchetti<sup>1\*</sup>, Giada Bargione<sup>1,2</sup>, Andrea Petetta<sup>1</sup>, Claudio Vasapollo<sup>1</sup> and Massimo Virgili<sup>1</sup>

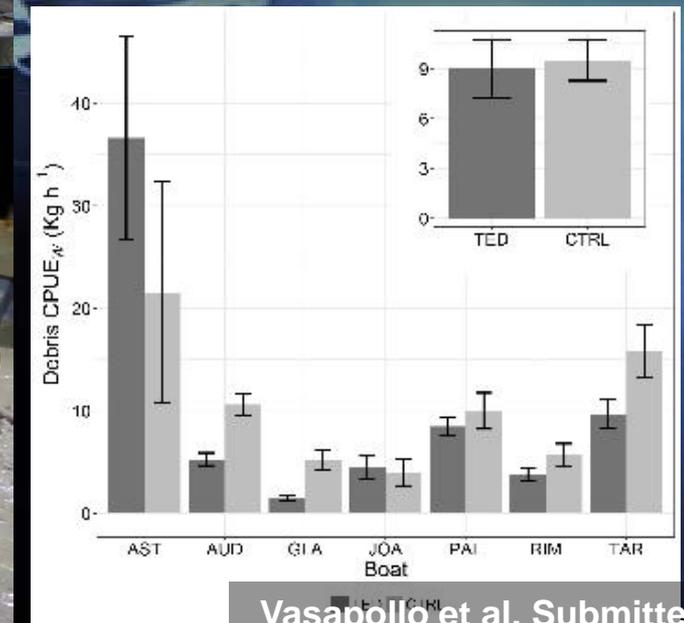

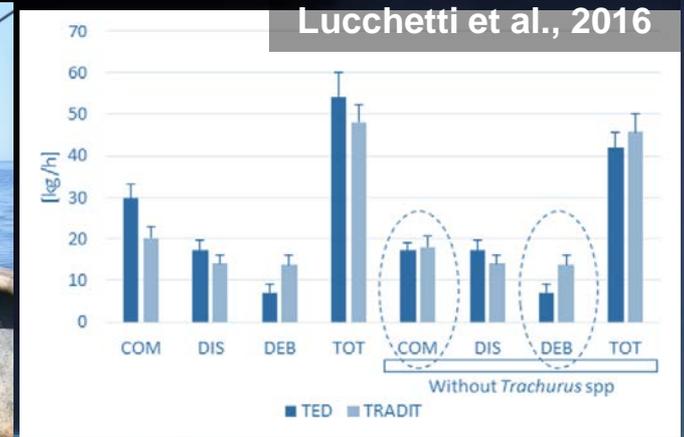

<sup>1</sup> National Research Council (CNR), Institute of Biological Resources and Marine Biotechnology (IBRIM), Ancona, Italy, <sup>2</sup> Department of Biological, Geological, and Environmental Sciences, University of Bologna, Bologna, Italy

The sea turtle (*Caretta caretta*) is the most common sea turtle in the Mediterranean, where incidental catches due to fishing activities are considered the main threat to its conservation. Over 50,000 capture events and likely over 10,000 deaths are estimated

### RECOMMENDATION FOR MANAGEMENT MEASURES FOR MEDITERRANEAN SWORDFISH IN THE FRAMEWORK OF ICCAT

#### Technical characteristics of the fishing gear

9. The maximum number of hooks that can be set or taken on board of vessels targeting swordfish should be fixed at 2800 hooks for swordfish fishery. A second set of rigged hooks may be allowed on board for trips longer than 2 days provided that are duly lashed and stowed in lower decks so that it may not readily be used.
10. Hook size should never be smaller than 7 cm of height for fishing targeting swordfish.
11. The length of the pelagic longlines will be of maximum 30 NM (55 km).

# Reducing turtle bycatch

## Depth setting

- Sea turtles spend the majority of their time in the upper column (<~40 m) which explains why rates of interactions in shallow-set longline fisheries are an order of magnitude higher than on deep-set gear (Gilman et al.2006)

OPEN [Assessment of interactive acoustic deterrent devices set on trammel nets to reduce dolphin–fishery interactions in the Northern Tyrrhenian Sea](#)

Ilaria Ceciarini<sup>1,2</sup>, Enrica Franchi<sup>2</sup>, Francesca Capanni<sup>2,3</sup>, Giulia Consales<sup>2</sup>, Lorenzo Minoia<sup>1,3</sup>, Stefania Ancora<sup>1</sup>, Antonella D'Agostino<sup>1</sup>, Alessandro Lucchetti<sup>1</sup>, Daniel Li Voli<sup>1</sup> & Letizia Marsili<sup>1,2,4</sup>

The absence of dolphin in the neighbourhood of fishing areas thanks to the use of pingers increases the diversity of target species.

Catch damages caused by dolphins were statistically higher in nets without pinger than in nets with pinger ( $p < 0.05$ ).

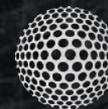

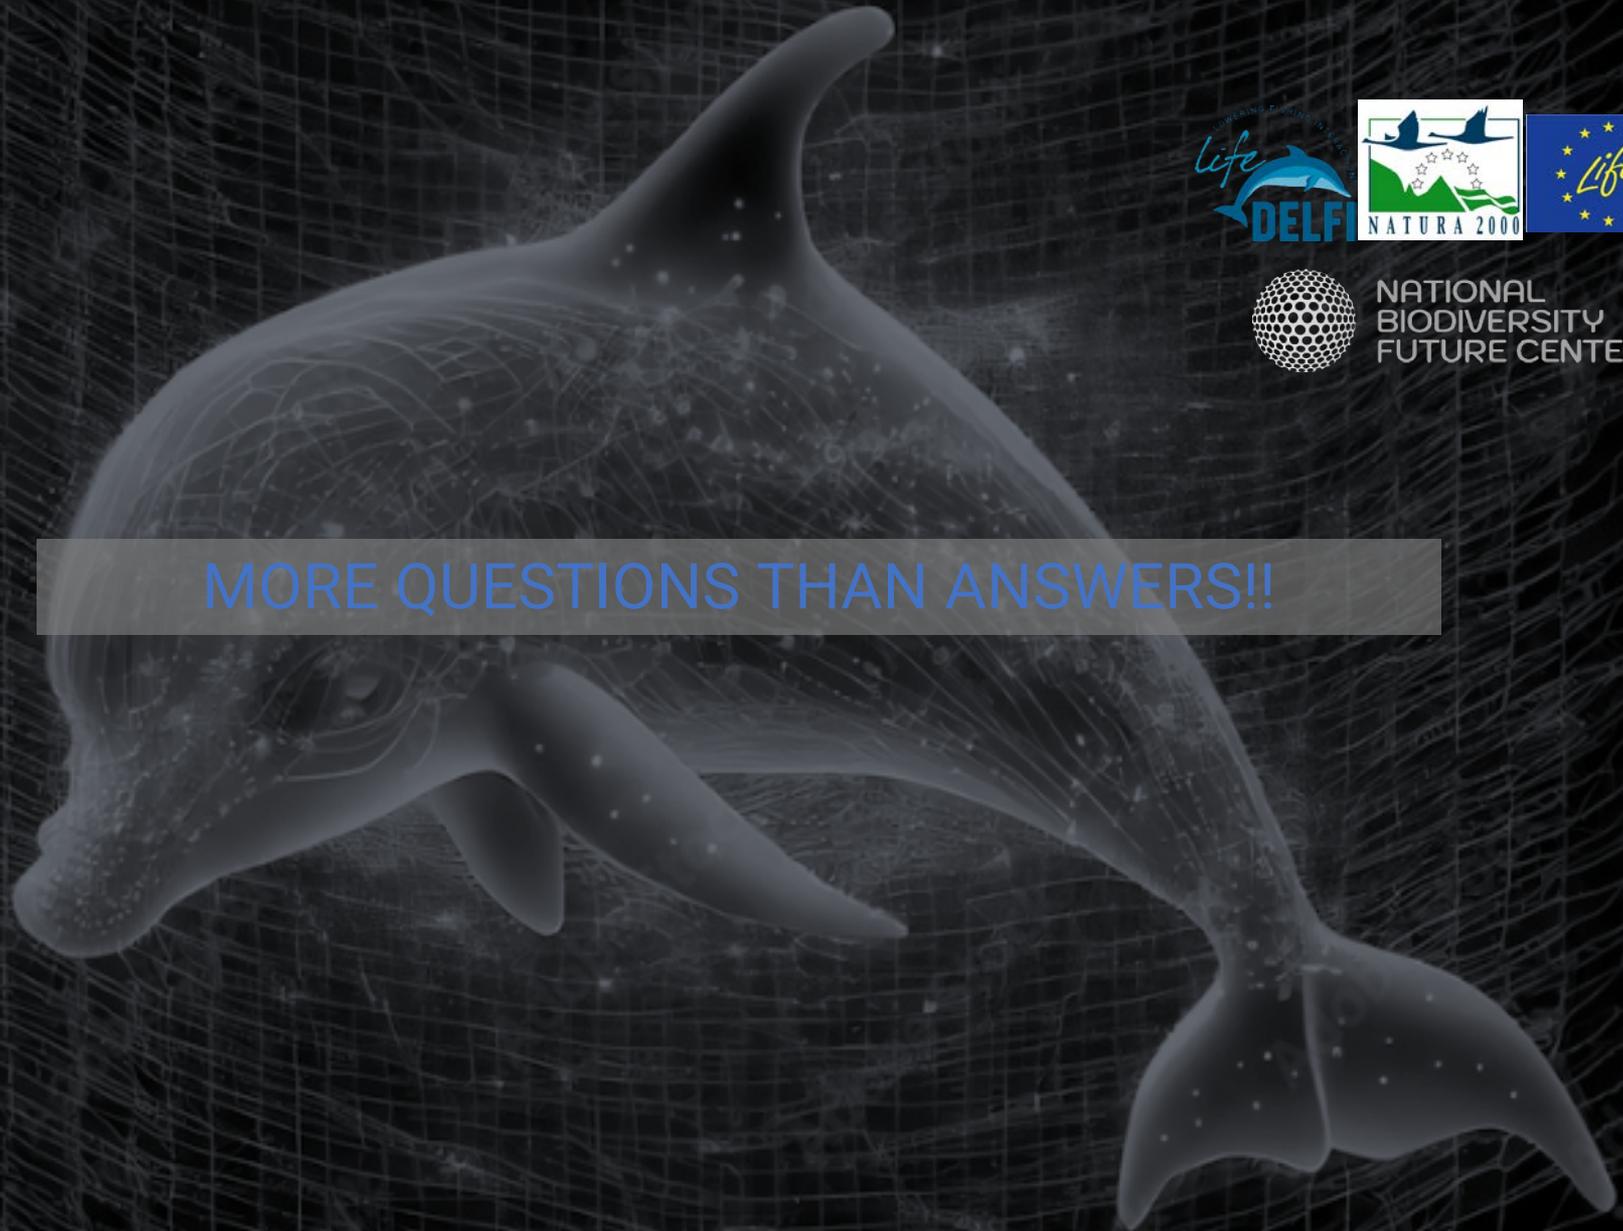

- **Dolphin conservation faces numerous challenges**, from habitat degradation to human activities impacting marine ecosystems, firstly fishing.
- **Advancements in digital technologies** offer promising solutions to address these challenges.

1. Artificial intelligence for dolphin detection
2. Photo identification platforms
3. Mobile applications (APP) to report dolphin sightings

## PILOT ACTION: PASSIVE ACOUSTIC MONITORING

scientific data

OPEN  
DATA DESCRIPTOR **A WAV file dataset of bottlenose dolphin whistles, clicks, and pulse sounds during trawling interactions**

Francesco Di Nardo<sup>1,2</sup>, Rocco De Marco<sup>2,3</sup>, Alessandro Lucchetti<sup>1,2</sup> & David Scaradozzi<sup>1,2</sup>

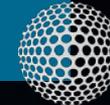

Globally, interactions between fishing activities and dolphins are cause for concern due to their negative effects on both mammals and fishermen. The recording of acoustic emissions could aid in detecting the presence of dolphins in close proximity to fishing gear, elucidating their behavior, and guiding potential management measures designed to limit this harmful phenomenon. This data descriptor presents a dataset of acoustic recordings (WAV files) collected during interactions between common bottlenose dolphins (*Tursiops truncatus*) and fishing activities in the Adriatic Sea. This dataset is distinguished by the high complexity of its repertoire, which includes various different typologies of dolphin emission. Specifically, a group of free-ranging dolphins was found to emit frequency-modulated whistles, echolocation clicks, and burst pulse signals, including feeding buzzes. An analysis of signal quality based on the signal-to-noise ratio was conducted to validate the dataset. The signal digital files and corresponding features make this dataset suitable for studying dolphin behavior in order to gain a deeper understanding of their communication and interaction with fishing gear (trawl).

A dataset of acoustic recordings (WAV files) collected during interactions between common bottlenose dolphins (*Tursiops truncatus*) and fishing activities in the Adriatic Sea.

# Handling practices

With the contribution of the EU LIFE Programme

## Handling and release of cetacean bycatch

Animals that have been accidentally captured undergo heavy stress, the cause of which is often difficult to immediately identify. This can lead to unpredictable reactions on the part of the animal, so it is important to learn how to handle the animals as gently as possible while maintaining an otherwise quiet and peaceful environment to avoid adding further stresses to the situation. In fact, these small considerations increase the likelihood of cetacean survival. If there is any doubt as to whether an animal is already dead or simply unresponsive, it is always better to act as though the animal were still alive, taking the same care and precautions used when managing an animal to return it to the water as soon as possible.

**REMEMBER TO NOTIFY THE COAST GUARD AT THE TOLL FREE NUMBER 1530 TO RECORD THE DETAILS OF THE CATCH INCLUDING:**

- Date
- GPS position (coordinates)
- Fisherman's contact information
- Boat name
- UE number
- Type/purpose of trip
- Fishing gear involved [e.g., net length, number of fishing lines, the duration of the trip, etc.]

**IT IS IMPORTANT TO INCLUDE**

- The name of the species captured
- The number of individuals
- Any additional notes (e.g., condition, any injuries/wounds, particular details, etc.)

**IF POSSIBLE, TAKE A PICTURE OF THE ANIMAL**

- When lifting the animal on board, be sure to **avoid any rotation in the fins or tail while handling the net**. If this is not possible, return the entangled animal to the water and allow it to readjust to a better position before lifting again to avoid causing injury during the recovery process
- Ensure that the animal is **not in a position to hit any external objects**. It is advisable to attach an additional rope to the net as close to the animal as possible to have better control over its movements
- Position the animal in the **shade**, in a peaceful and secure location and away from any engine exhaust coming from the fishing vessel

**marine**

## COME SALVARE UNA TARTARUGA MARINA

RIDUZIONE DELLA MORTALITÀ DELLA TARTARUGA MARINA NELLE ATTIVITÀ DI PESCA PROFESSIONALE

### RECUPERO 1

- ✓ Liberata da reti e lenze con cura, facendo attenzione alla bocca e alle unghie.
- ✓ Afferrala solo dalle estremità del carapace, non dalle pinne.
- ✓ Se ha abboccato all'amo issala a bordo utilizzando un retino.
- ✗ Mai lasciarla capovolta sul carapace.

### 2 VALUTAZIONE STATO DI SALUTE

#### È in buone condizioni

- Se sollevandola muove le pinne ed è molto attiva.
- Se stimolata con le dita negli occhi reagisce chiudendo le palpebre.
- Se pinzando la zona vicino all'ano con le dita la tartaruga reagisce.
- Falla riposare per un paio d'ore poi liberata.
- Se non si è sicuri delle condizioni, allertare la Capitaneria o il Centro di Recupero più vicino.

#### Non è in buone condizioni

- Se sollevandola è poco reattiva e non muove le pinne.
- Se stimolata con le dita negli occhi non reagisce chiudendo le palpebre.
- Se pinzando la zona vicino all'ano con le dita la tartaruga non reagisce.
- Allerta la Capitaneria e il Centro di Recupero più vicino.

### PRIMO SOCCORSO 3

- ✓ Se è stata catturata nelle reti stendila a pancia in giù in un luogo tranquillo su una superficie morbida, sollevando il posteriore di 20-30 cm per far defluire dai polmoni eventuale acqua ingerita.
- ✓ Se ha abboccato all'amo di un palangaro taglia la lenza il più vicino possibile alla bocca (Regolamento (UE) 2017/2107) e tagala ad un pezzo di legno o plastica in modo che non la ingoi. Non tentare di aprire la bocca con strumenti vari né di tirare la lenza cercando di estrarre l'amo dalla bocca. In estate tienila all'ombra e coprila con un asciugamano bagnato sul carapace.
- ✗ Non tenerla immersa in acqua. In inverno tienila in un luogo caldo e asciutto e coprila con una coperta. Copri la testa e gli occhi, ma mai le narici.

- ✓ Osserva se sono presenti targhette (in genere) sulle pinne. Prendi nota dell'ora e posizione di cattura. Misura le dimensioni del carapace.

### 4 RILEVAMENTO DATI

- ✓ Consegnala al personale della Capitaneria di Porto o del Centro di Recupero, se in cattive condizioni oppure se ferita o se ha ingerito un amo.

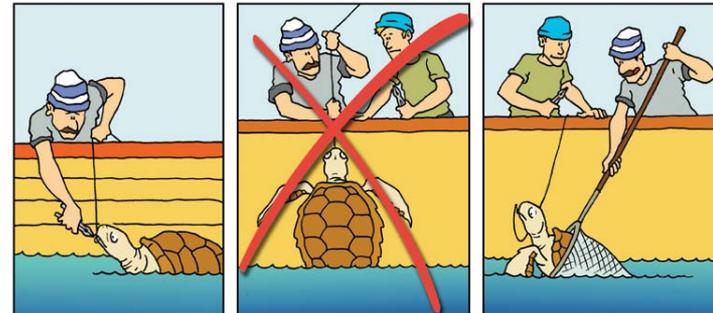

Contatti

### LIBERAZIONE 5

- ✓ Se è in buone condizioni liberata delicatamente, cercando di lasciarla solo quando è vicina alla superficie dell'acqua, a motore in posizione neutra, senza le reti in acqua.

netcet LET'S SAVE OUR SEA TURTLES  
NETWORK FOR THE CONSERVATION OF CETACEANS AND SEA TURTLES IN THE ADRIATIC

#### LONGLINE

A long line kills the turtle. Cut the line close to mouth, but do not pull it or the hook will harm the turtle more. Remove the hook only if it can be done without injury to you or the turtle.

# How to involve fishers

Communication:  
Change public perception

# How to involve fishers

## Engagement and responsibility

- **Bottom-up approach**: involving fishers from the early stages, seeking to develop technical solutions together (as well as any management measures)
- Consult with fishing communities early on to **gather their input, address their concerns, and incorporate their knowledge** on fishing gears (and into the design and management of MPAs).
- Involve fishers as participants and **active actors in the conservation process** (as stewards of the marine environment). This will enhance compliance and enforcement strategies (even in AMPs)

# How to involve fishers

## Trust of fishers

- Inclusive approach that recognizes their expertise, concerns, and needs
- Demonstrate competence (including technical competence) on issues that concern them
- To demonstrate empathy for their issues beyond those strictly related to the project
- Embarking with them helps a lot in getting closer to them, because it creates an atmosphere of complicity, as they know that we understand their problems and their hardships.

# How to involve fishers

## Education, Outreach and capacity building

- Provide fishers with clear and accessible information about the purpose and benefits of the new gears/devices/measures (and MPAs).
- Offer educational workshops, presentations, and marine conservation objectives and the role of new sensitive species, fish stocks and habitats.
- Provide training, technical assistance (and eventual engage in monitoring of sensitive species (and co-

### Handling and release of cetacean bycatch

Animals that have been accidentally captured undergoing stress, the cases of which often difficult to immediately identify. This can lead to unpredictable reactions on the part of the animal, so it is important to learn how to handle the animals as gently as possible while maintaining an otherwise quiet and peaceful environment to avoid adding further stresses to the situation.

In fact, these small considerations increase the likelihood of cetacean survival. When in any doubt as to whether an animal is already dead or simply unresponsive, it is always better to act as though the animal were still alive, taking the same care and precautions used when managing an animal to return it to the water as soon as possible.

#### REMEMBER TO NOTIFY THE CAPTAIN/GUARD AT THE TOLL FREE NUMBER 1630 TO RECORD THE DETAILS OF THE CATCH INCLUDING:

- Date
- GPS position (coordinates)
- Fisherman's contact information
- Boat number
- UK number
- Type (purpose) of log
- Fishing gear involved (e.g. net length, number of fishing lines, the duration of the trip, etc.)

#### IT IS IMPORTANT TO INCLUDE:

- The name of the species captured
- The number of individuals
- Any additional notes (e.g. conditions, any significant wounds, particular details, etc.)

When lifting the animal on board, be sure to avoid any reaction in the boat or sea while handling the net, or this is not possible, orient the entangled animal to the water and allow it to re-adjust to a better position before lifting again to avoid causing injury during the recovery process.

Ensure that the animal is set in a position to let any animal breathe. It is advisable to attach an additional rope to the net or to the animal so it is possible to have better control over its movements.

Position the animal in the shade, in a seaward (and upwind) location and away from any engine exhaust coming from the fishing vessel.

**IMPOSSIBLE, TAKE A PICTURE OF THE ANIMAL.**

### COME SALVARE UNA TARTARUGA MARINA

INDICAZIONI DELLA MORTALITÀ DELLA TARTARUGA MARINA NELLE ATTIVITÀ DI PESCA PROFESSIONALE

#### RECUPERO 1

- Liberate da tutti i tessuti con cura, tenendo attenzione alla bocca e alla lingua.
- Afferrate solo dalla estremità del carapace, non dalla pelle.
- Se ha affocato con gli arti tenete a bordo utilizzando un retino.
- Per il trasporto è prevista la cassetta per tartarughe.

#### 2 VALUTAZIONE STATO DI SALUTE

**È in buone condizioni:**

- Se stimolata riesce a girare e a nuotare attive.
- Se stimolata con la dita negli occhi reagisce chiudendo le palpebre.
- Se provocata la zampa riesce ad appiarsi con la dita la tartaruga reagisce.
- Falle il respiro per un paio d'ore può liberarsi.
- Se non si è sicuri delle condizioni, alertare la Capitaneria e il Centro di Recupero più vicino.

**Non è in buone condizioni!**

- Se stimolata si muove ma non riesce a girare.
- Se stimolata con la dita negli occhi non reagisce chiudendo le palpebre.
- Se provocata la zampa non si appiaccia con la dita la tartaruga non reagisce.
- Alertare la Capitaneria e il Centro di Recupero più vicino.

#### PRIMO SOCCORSO 3

- Se il livello di ossigeno nella rete è molto basso e l'animale è in pericolo in un luogo tranquillo su una superficie morbida, addeberlo il gasossigeno di 20-30 litri per far abbassare del tutto il livello di ossigeno.
- Se lo abbiamo afferrato in un palancone togli la lenza il più vicino possibile alla bocca (2-3 metri) e se non è possibile, togli la lenza ad un pezzo di legno e attivalo in modo che non la inghi. Non tentare di aprire la bocca con strumenti così noi il lenza con cautela di evitare il trauma della bocca.
- In attesa della ambulanza e spiega con un asciugamano bagnato sul carapace.
- Non toccare nessuno dei occhi.
- In attesa della ambulanza e spiega con un asciugamano bagnato sul carapace.
- Copri la testa e gli occhi, ma non i narici.

#### 4 RILEVAMENTO DATI

- Osserva se sono presenti i gergoglio (in generale sulle pinne).
- Prendi nota dell'ora e posizione di cattura.
- Misura le dimensioni del carapace.
- Consigliati al personale della Capitaneria di Porto e del Centro di Recupero, se in cattiva condizione oppure se ferito e ha bisogno di aiuto.

#### LIBERAZIONE 5

- Se è in buone condizioni liberarlo delicatamente, cercando di tenerlo sotto controllo a ridosso della superficie dell'acqua, e mettere in posizione recata, senza di tutti i soccorsi.

Tel: 1630  
Chiamare GP e, se presente, centro di recupero più vicino

Contatti

# How to involve fishers

## Business (avoiding commercial loss)

- **Recognize the economic concerns** of fishermen who may be impacted by new devices (and MPA regulations).
- **Alternative Livelihoods:** explore opportunities for alternative activities and gears, such as eco-tourism, sustainable aquaculture, and other alternative sources of income to offset economic losses and provide alternative employment.
- **Recognize and incentivize conservation goals** (e.g., through certification schemes, eco-labels, and conservation goals (e.g., labelling)).

Compensation?

# How to involve fishers

## Presence

- Fishers must 'feel' the **constant presence** of the researchers (or MPA representatives).
- Too often, activities only go on as long as there is a project that guarantees a certain relationship.
- Then **when the project is over**, the presence disappears and the fishermen gradually lose interest in conservation and abandon the good practices undertaken

*Now when the dolphin is caught and perceives itself to be trapped in the net, it bides its time, not at all disturbed but well pleased, for it feasts without stint on the fish that have been gathered with no trouble to itself. But as soon as it comes near the shore, it bites its way through the net and makes its escape. Yet if it should not get away in time, on the first occasion it suffers no harm: the fishermen merely sew rushes to its crest and let it go. But if it is taken a second time, they recognize it from the seam and punish it with a beating. This, however, rarely occurs: most dolphins are grateful for their pardon in the first instance and take care to do no harm in the future.*

*Plutarch (46-120 A.D)- De sollertia animalium (On the Intelligence of Animals)- chap. 26*

Thank you
