Land take drivers in EEA-39 and in EU-28 - 2000-2018 (km<sup>2</sup>/year) — Land take drivers in EEA-39 and EU-28 during 2000-2018 and 2012-2018

# Land take: interactive dashboards

## Land take 2000-2018

Dashboard (Tableau) — Prod-ID: DAS-106-en — Published 10 Sep 2019 — 1 min read

Topics: Land use Biodiversity — Ecosystems Soil

This interactive data viewer provides a set of dashboards giving an overview of the land take and net land take processes for Europe (EEA39 and EU28) derived from the CORINE land cover data series. Statistics are derived for every 6 years of the acquisition period, as well as for the entire period (2000-2018). The viewer facilitates the assessment of land take over a specific period as well as the land use drivers of the observed changes, which can be analyzed within user defined spatial units such as administrative regions, biogeographical regions or land cover classes.

<	Introduction	Overview statistics	Land take statistics - table	Land take statistics - chart	Net land take statistics - table	Net land take statistics - chart	Land take statistics - country map	Land take statistics - NUTS3 map	>
---	--------------	---------------------	------------------------------	------------------------------	----------------------------------	----------------------------------	------------------------------------	----------------------------------	---

Land is a finite resource. The way land is used is one of the principal drivers of environmental change with strong impacts on ecosystems. Land use in Europe is driven by a number of factors such as the increasing demand for living space per person, the link between economic activity, increased mobility and the growth of transport infrastructure, which usually result in urban expansion. Urbanisation rates vary substantially, with coastal and mountain areas among the most affected regions in Europe as a result of increasing demand for recreation and leisure.

# Soil sealing

<	The indicator	Europe in numbers	Sealed surface status per NUTS3	Sealed surface change per country years	Cumulative surface increase	Sealing increase compared 2006	Sealed surface by Ecosystem type	>
---	---------------	-------------------	---------------------------------	---	-----------------------------	--------------------------------	----------------------------------	---

Km<sup>2</sup> of sealed surface by year

A constant increase of sealed surface is registered in Europe, in EEA39 as well as in EU28 countries, while the rate of change decreased in the last period (2012 - 2015) especially in EU28 countries.

Km<sup>2</sup> of changes in sealed surface among years

Revert Refresh Pause

# CLC +

---

- Higher resolution 0,5 ha MMU
- Clear separation between LC and LU
- Object-oriented description instead of classification
- Complete coverage of themes LC and LU
- Modelling of temporal phenomena
- Applicable on national and European level

# Conclusions

- CLC provides an European wide assessment on land take, but
  - Resolution is too coarse
  - Exclusion of green urban areas from land take?  
This could be easily solved. However, it could reflect certain degradation  
forest -> green urban area

# Conclusions

---

- Urban Atlas
  - Provides a better resolution
  - Only for FUAs

# Conclusions

---

- Soil sealing
  - Provides a better resolution
  - Higher monitoring frequency (every 3 years)
  - Does not allow to know what type of land has been lost
  - Land take has impacts beyond the exact place where the change is occurring. Change in soil sealing only identifies where the (irreversible) change occur.

# Conclusions

---

- Looking forward
  - Identify type of land lost by crossing CLC and soil sealing (with the limitations of resolution)
  - Calculation of the indicator with CLC+
  - Need to consider land take in context
    - Urban / peri-urban / rural
    - Other dynamics (e.g. land reuse/recycling)

A photograph showing a rural landscape in the foreground with several cows grazing in a field. In the background, there are modern, multi-story buildings under construction, with a large crane visible. The sky is blue with scattered white clouds.

Thank you very much for your attention!
